A. Disassemble the Sub-assembly Inner Case from the Sub-assembly Outer Case.

- (1) Place the inner/outer sub-assembly unit (5-330/420) on the worktop, flanged face downward. Using the alignment pin (Tool 3064) establish the positions of the three equi-spaced alignment holes and suitably mark the outside of the case at these locations for reassembly convenience. If the alignment holes have not been bored then refer to SB.72-8260-187 for the rework procedure.
- (2) Unscrew and remove the six slave bolts and washers assembled to the front flange, place the bolts and washers in a container.
- (3) Unscrew and remove the hand knob and clamping ring from the fixture (Tool 3065).
- (4) Place the case unit on the base plate of a suitable press, then locate the clamping ring on the front (top) of the case.
- (5) Operate the press and apply sufficient load to the clamping ring to carefully press out the inner case. Place the outer case in a protective container, then remove the clamping ring from the inner case.

B. Disassemble the Segments.

NOTE: The sub-assembly inner case (5-330) and the three segments are a matched set and must be kept together.

- (1) For reassembly convenience, note the relative positions of the segments.

sneema

- (2) Observe the TOP position of the fixture base plate (Tool 3065) then assemble the sub-assembly inner case (5-330) to the plate so that the location pin in the front flange of the case aligns the TOP of the fixture and the location dowel in the base plate enters the bottommost hole in the rear flange of the case.
- (3) Assemble the clamping ring to the case and secure with the hand knob.
- (4) Remove and discard the locking wire attached to the vent plugs and locking plates.
- (5) Carefully de-torque, unscrew and remove the six vent plugs from the inner case.
- (6) Unscrew and remove the hand knob and clamping ring, then remove the segment securing nuts and bolts and segments, and place the items in a container.
- (7) Remove the case from the fixture, and place the case in a container, then reassemble the clamping ring and hand knob to the fixture.

12. Disassemble the LP Bearing Housing Assembly

A. Remove the LP Bearing (Ref.Fig.116).

- (1) Remove the LP bearing housing assembly from its protective container and with the oil transfer tube uppermost, place the assembly on a worktop.
- (2) Remove the bolt and retaining plate securing the oil transfer tube, then withdraw the tube. Place the tube, bolt and retaining plate into a container.
- (3) Unscrew and remove the 30 bolts captive in the front inner and outer air baffle.
- (4) Remove the bolts securing the bearing retainer, then disassemble the retainer from the locating dowels, place the bolts and retainer into a container.
- (5) Unscrew the thumbnut securing the retainer plates to the bearing, then remove the top plate and lower the bottom plate.

NOTE: Assistance may be required to immobilize the bearing housing.

SNECMA

- (6) Carefully lift the bearing from its housing taking care to retain the loose inner tracks, then place the bearing in a protective container. Remove the oil thrower from the bearing housing and place in a container.
 - (7) Lift the bearing housing assembly clear of the bottom bearing retainer plate, then invert the housing leaving the baffles uppermost.
 - (8) Reassemble the bearing retaining plates to each other and secure with the thumbnut, then place it with the other tools.
- B. Disassemble the Air Baffles, Thrust Washer and Inner Labyrinth Housing (Ref.Fig.116).
- (1) Using a suitable driver and hammer, disengage the outer labyrinth housing from the inner labyrinth housing. Place the outer labyrinth housing and air baffle into a container.
- NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8334-205).
- (2) Remove the 24 locknuts securing the inner labyrinth housing to the bearing housing, then using the ring (Tool 851) and mechanical driver/puller (Tool 897 and 828) disassemble the thrust washer double D-head bolts and inner labyrinth housing. Place the items in a container.
- NOTE: The disassembly of the intermediate case assembly is now completed, ensure that all of the disassembled components are clearly identified, and that matched items are kept together. If necessary, place components in protective containers before their transfer to the cleaning area.
- (3) Ensure that the module plate remains with the assembly.

13. Disassemble the LP and HP Compressor Thrust Bearings

A. General.

CAUTION: SETS OF ROLLERS, CAGES AND TRACKS OF EACH BEARING MUST BE LABELLED RELATIVE TO THEIR POSITIONS AND KEPT TOGETHER AS A SET.

- (1) Clean each bearing prior to disassembly (Ref.72-09-00 Cleaning Process D).
- (2) The following disassembly procedure on each bearing should be carried out in an approved 'clean' room.
- (3) On completion of the disassembly of the bearings, it may be necessary to either code or serialize the matched items (Ref. SB.72-17).

B. Disassemble the LP Compressor Thrust Bearing.

- (1) Arrange a cloth or similar material to 'cushion' the balls should they fall from the cage.
- (2) With the loose inner tracks removed, pass the forks of the extractor (Tool 1984) between the bearing cage and the outer track, then continue to slide the extractor in until enough pressure is applied to press the ball from the cage.
- (3) Remove the next ball from the cage by inserting the hook of extractor (Tool 1985) into the hole left by the removal of the first ball. Remove the remainder of the balls from the cage, then remove the cage and the remaining inner track.
- (4) Remove the first ball from the second cage using extractor (Tool 1984), then remove the remaining balls using extractor (Tool 1985). Remove the cage when released.

C. Disassemble the HP Compressor Thrust Bearing.

- (1) Arrange a cloth or similar material to 'cushion' the balls should they fall from the cage.

OVERHAUL

HP COMPRESSOR ASSEMBLY - DISASSEMBLY

1. General

- A. Prior to commencing the disassembly, refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the check balance, removal of the intermediate case assembly, disassembly of the HP compressor assembly, and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001, 1002 and 1003. Where special tools are quoted in the disassembly for storage and protection of the rotor blades, disks etc. suitable alternative containers and protectors may be used.
- C. The HP compressor assembly will be received from engine bulk disassembly in a mobile stand with the intermediate case assembled, the intermediate case sitting in the stand. Dependent on whether the HP compressor assembly requires a check balance or not, will determine what adapters, sleeves etc. are assembled.
- D. A check balance of the HP compressor is not a normal feature of disassembly and need only be carried out if detailed by the defect investigation or inspection departments. If a check balance is required, items of the HP turbine section have been identified by their Illustrated Parts Catalogue (I.P.C.) number (72-51-03/1-90) for easy identification. The breakdown number is quoted first, 72-51-03 followed by the I.P.C. Fig.No.1 and the Item No.90.
- E. Prior to the check balance and/or disassembly of the HP compressor, the intermediate case assembly must be removed. The preparation for removal of the intermediate case will vary on whether the compressor is to be balanced or not, but the actual procedure for removal of the intermediate case is identical.
- F. If a check balance is required, the procedure cannot be carried out on the normal disassembly stand, but must be carried out on the assembly stand. The procedure entails the assembly of the HP turbine assembly, the balancing and concentricity checks of the assembly, then the removal of the turbine assembly and a final balance of the HP compressor. The assembly is then disassembled in the normal manner in the disassembly stand.

OVERHAUL

2. Remove the Intermediate Case Assembly from the HP Compressor Assembly

NOTE: If the HP compressor assembly is to be checked balanced, prepare for the removal of the intermediate case as detailed in para.A. For normal disassembly, prepare for the removal of the intermediate case as detailed in para.B.

A. Prepare a Check Balance Assembly for the Removal of the Intermediate Case Assembly (Ref.Fig.101).

- (1) Release and withdraw the mobile stand clamps securing the intermediate case to the stand (Tool 1036) (Ref. Fig.101). Attach a hoist to the lifting fixture (Tool 1043) (on top of the assembly), then raise the hoist until the assembly is clear of the stand. Position the assembly alongside the pit stand (Tool 1027).
- (2) With the arms of the stand extending upwards, traverse the assembly sideways into the stand so that the rear bearing adapter extensions are above the stand arms. Align the holes in the adapter extensions with the locating pins and studs in the stand arms, then lower the assembly onto the arms. Assemble washers and nuts to the studs and fully tighten the nuts (Ref.Fig.102).
- (3) Unscrew the lifting fixture until released, then raise the hoist. Unscrew and remove the slave nut (Tool 1042) from the LP drive shaft, then lower the hoist and screw the fixture back onto the spacer sleeve. Unscrew the spacer sleeve until released from the HP drive shaft, then raise the hoist until the sleeve is clear of the LP drive shaft. Lower the sleeve onto a suitable surface, then disconnect the hoist from the lifting fixture and remove the fixture from the sleeve. Unscrew the cap screws of the split sleeves (Tool 1058) then remove the sleeves from the HP and LP drive shafts.
- (4) Screw the guide sleeve (Tool 377) onto the rear (top) end of the LP drive shaft. Lower the HP drive shaft support sleeve (Tool 1031) over the LP drive shaft and onto the HP drive shaft engaging the splines and resting it on the bearing (Ref.Fig.102).

OVERHAUL

- (5) Lower the mechanical jack (Tool 1029) over the support sleeve and align the captive bolts with the tapped holes in the rear adapter. Unscrew the jack (if required), to allow the jack to abut the adapter, then screw the captive bolts into the adapter. Using the tommy bars, screw in on the jack until it abuts the support sleeve, then release the jack half a turn. Temporarily lock the jack by tightening the lockring against it.
- (6) Lower the LP drive shaft support sleeve (Tool 1030) into the assembled HP support sleeve and screw it onto the HP drive shaft until it abuts the other sleeve, then release the sleeve one and a half turns.
- (7) Rotate the pit stand arms 180 deg until the intermediate case is uppermost.

NOTE: Refer to para.C. and remove the intermediate case assembly.

B. Prepare the Assembly for the Removal of the Intermediate Case Assembly.

NOTE: Para.B. applies to assemblies not requiring a check balance.

- (1) Remove the split sleeves from between the HP and LP drive shafts(Ref.Fig.103).
- (a) Attach a hoist to the lifting fixture (Tool 1043), unscrew the fixture until released from the spacer sleeve (Tool 391) then raise the hoist. Release and remove the slave nut (Tool 1042) from the LP drive shaft, then lower the hoist and screw the lifting fixture back onto the spacer sleeve.
- (b) Unscrew the spacer sleeve until released from the HP drive shaft, raise the hoist sufficient to enable removal of the split sleeves (Tool 1058). Unscrew the cap screws of the split sleeves then remove the sleeves from the HP and LP drive shafts.

OVERHAUL

- (c) Lower the hoist and screw the spacer sleeve onto the HP drive shaft. Unscrew the lifting fixture until released from the sleeve, then screw the slave nut (Tool 1042) onto the LP drive shaft until it abuts the sleeve. Screw the lifting fixture (Tool 1043) back onto the sleeve.
- (2) Invert the HP compressor/intermediate case assembly (Ref.Fig.104).
- (a) Release and withdraw the stand clamps securing the intermediate case to the mobile stand (Tool 1036). Ensure that the lifting fixture (Tool 1039) under the intermediate case is secured to the case.
- (b) With the hoist still attached to the lifting fixture (Tool 1043), raise the hoist until the assembly is clear of the stand, then position the hoist next to another hoist in an area clear of obstruction that will permit the HP compressor/intermediate case to be inverted.
- (c) Attach the second hoist to the eye end of the lifting fixture plate (Tool 1039) and ensure that when the plate is raised it will rest on the lifting plate pad. Ensure that the lifting fixture attached to the first hoist, is aligned with the plate attached to the second hoist and that it will pivot correctly.
- (d) Steadily raise the second hoist and lower the first hoist until the complete assembly is inverted, then disconnect the first hoist.
- (3) Unscrew and remove the lifting fixture from the (lower) end of the spacer sleeve, then unscrew and remove the slave nut from the (lower) end of the LP drive shaft. Screw the protector (Tool 403) onto the end of the spacer sleeve (Ref.Fig.104).

- (4) Ensure that the container (Tool 1050) is positioned in the hole beneath the disassembly stand (Tool 1040), then position and lower the HP compressor into the stand (Ref.Fig.105). Position the stand clamps over the HP case flange, then secure the clamps with the knurled nuts. Position the platforms (Tool 1233) around the stand.
- (5) Release and remove the slave nuts and washers securing the lifting fixture to the intermediate case. Raise the hoist until the fixture is clear of the case, then position and lower the fixture onto a suitable support. Disconnect the hoist and lower the lifting fixture plate onto its pad.
- C. Release and Remove the Intermediate Case Assembly.
- (1) Release the captive bolts securing the support steady (Tool 396) to the intermediate inner case, then withdraw the steady (Ref.Fig.102).
- (2) Unscrew and remove the two bolts securing the LP probe in the inside of the intermediate inner case, then withdraw the LP probe, retaining plate and the two adjusting washers (Ref.Fig.106).
- (3) Remove the static seal housing using the mechanical puller (Tool 1962).
- (a) Unlock the keywashers then unscrew and remove the 12 bolts securing the static seal housing to the intermediate case.
- (b) From the extractor, unscrew and remove the three extractor claws from their parking position in the larger of the two plates.
- (c) Position the extractor, large plate first, over the LP drive shaft and rest the smaller plate on the end of the shaft. Insert the extractor claws through the slots in the larger plate and engage the claws beneath the seal housing, tighten the knurled thumbscrews to secure the claws.

- (d) Screw in the three extractor bolts, in equal progressive increments, and draw the housing from its location. Unscrew the thumbscrews to disengage the claws from the housing, remove the extractor from the shaft then screw the claws into their parking holes in the larger plate. Remove the seal housing from the intermediate case.
- (4) Slide the protector (Tool 427) over the LP drive shaft, then using the pliers (Tool 1523), release the locking washer from the retaining nut. Remove the protector from the shaft.
- (5) Release the bearing retaining nut(Ref.Fig.107).
- (a) Locate the spanner wrench steady (Tool 397) on the inner part of the intermediate case and secure the steady with its captive bolts.
- (b) Offer the immobilizer (Tool 387) over the LP drive shaft and engage it in the cut-aways inside the rotor shaft front.

NOTE: Before using the multiplier (Tool 1022), turn the input drive and note the direction of rotation of the output drive.

- (c) Ensure that the multiplier (Tool 1022) is bolted to the spanner wrench (Tool 386), then lower the spanner/multiplier over the LP drive shaft and immobilizer and engage the multiplier square drive in the immobilizer. Turn the HP rotor shaft as necessary to engage the spanner pin in the cut-away in the steady and the spanner dogs in the retaining nut.
- (d) Engage a wrench in the multiplier, then release the LEFT-HAND threaded retaining nut.
- (e) Remove the wrench, then withdraw the multiplier/spanner and the immobilizer from the rotor shaft front and steady. Use the hand spanner (Tool 1324) to unscrew the nut, then remove the spanner and release and remove the steady.

OVERHAUL

- (f) Withdraw the retaining nut and locking washer from the rotor shaft front.
- (6) Release and remove all nuts, bolts and brackets from the intermediate case rear flange/HP compressor case front flange. Place the items in suitable containers.
- (7) Assemble the lifting/extracting fixture (Tool 411) to the intermediate case (Ref.Fig.108).
- (a) Attach a hoist to the lifting ring of the fixture, then position and lower the fixture onto the intermediate case guiding the fixture pot over the LP drive shaft. Align the captive bolts of the fixture with the tapped holes in the inner case, then screw in the fixture handle (if necessary), to enable the fixture plate to abut the case. Screw the fixture bolts into the case and fully tighten the bolts.
- (b) Unscrew the fixture handle so that the fixture pot abuts the HP rotor shaft front, then continue unscrewing the fixture handle until the intermediate case/HP rotor bearing are released from the rotor shaft front.

NOTE: The fixture handle will be stiff to turn, but this is normal.

- (8) Raise the hoist until the intermediate case is clear of the LP drive shaft, then position the case over a suitable pallet. Bolt three (evenly spaced) transport blocks (Tool 1232) to the rear (bottom) flange of the outer case, then lower the case and rest the blocks on the pallet. Release the captive bolts of the lifting fixture, then remove the fixture from the case and the hoist.
- (9) Withdraw the adjusting washer from the rotor shaft front.

NOTE: The intermediate case assembly can now be transferred to its disassembly section (72-32-00, Disassembly).

NOTE: If the HP compressor assembly is not to be worked on immediately, lower the protector (Tool 1246) over the LP drive shaft and rest it on the HP compressor case.

OVERHAUL

NOTE: If the HP compressor assembly requires a check balance proceed as detailed in para.3. If the assembly does not require a check balance, disassemble the HP compressor assembly as detailed in para.8.

3. Prepare and Check Balance the HP Compressor and Turbine Assembly

A. Assemble the Front Bearing Adapter to the HP Front Case and the Rotor Shaft Front (Ref.Fig.109).

- (1) Ensure that the slave bearing (Tool 1289) is assembled and secured to the front bearing adapter (Tool 1032). Offer the lifting/extracting fixture (Tool 1353) to the adapter, align the offset thumbscrew with the offset tapped hole in the adapter, then screw the thumbscrews into the adapter. Fully tighten the screws.
- (2) Screw the steady (Tool 288) onto the rotor shaft front, then remove the protector covering the top of the case (if assembled). Apply lubricant 'A' to bearing location on the rotor shaft front, then assemble the spacer ring (Tool 870) to the shaft (in lieu of the adjusting washer and oil thrower).
- (3) Ensure that the LP support sleeve (Tool 1030) has been unscrewed one and a half turns from contact with the HP support sleeve (Tool 1031) on the bottom of the rear bearing adapter. Release the mechanical jack (Tool 1029) lockring, then screw in on the jack to raise the HP compressor (approx.) 0.125 in. (4,0 mm) (Ref.Fig.102).

NOTE: Unless the LP support sleeve is loosened off from the jack, there is no operating clearance, and the jack cannot be operated.

- (4) Attach a hoist to the lifting/extracting fixture, then position and lower the front bearing adapter over the steady. Release the hoist, then screw the fixture onto the steady, pressing the slave bearing onto the rotor shaft front. Align the dowel hole in the front bearing adapter with the dowel in the HP front case (with the lifting eyes in the front and rear adapters aligned), then screw down on the fixture until the bearing is fully down. Release the thumbscrews securing the fixture to the front bearing adapter, then unscrew and remove the fixture. Unscrew and remove the steady from the rotor shaft front.

OVERHAUL

- (5) Locate the adapter (Tool 891) on the inner race of the front bearing adapter slave bearing. Screw the extension (Tool 521) onto the hydraulic mechanical driver (Tool 900). Lower the driver over the LP drive shaft until it abuts the rotor shaft front, then screw the driver housing onto the rotor (Ref.Fig.110).

NOTE: Do not overtighten.

- (6) Connect the feed pipe from a hand operated hydraulic pump to the hydraulic driver connection (Ref.Fig.110). Operate the hand pump and apply a pressure to the driver, ensuring that as the piston moves down, the thrust plate locates correctly over the adapter. Apply a pressure of 7500 lb in. (3,402 kg) to the driver.
- (7) Release the hydraulic pressure and check that the driver thrust plate rises (under its spring pressure). Disconnect the feed pipe from the driver, then unscrew and withdraw the driver and extension. Remove the adapter from the front bearing adapter.
- (8) Apply lubricant 'B' (Ref.72-09-00 Assembly) to the threads of the rotor shaft front, then assemble the spacer ring (Tool 988) and the 'LEFT-HAND' threaded retaining nut (72-61-00/1-10) to the rotor. Hand-tighten the nut using spanner wrench (Tool 1324).
- (9) With the dowel hole in the front bearing adapter engaged in, or aligned with, the dowel in the HP front case (Ref. para.(4)), and the bolt holes in the adapter and case aligned, lower the mechanical jack until the adapter abuts the HP case flange. Secure the adapter to the case with slave nuts and bolts. Lock the jack with its lockring.
- (10) Offer the steady (Tool 1158) to the front bearing adapter, align the bolts with the adapter holes, then screw the bolts into the adapter, fully tighten the bolts. Offer the immobilizer (Tool 387) (Ref.Fig.111) into the steady and over the LP drive shaft, and engage it in the cut-aways inside the HP rotor shaft front. Ensure that the multiplier (Tool 1022) is bolted to the spanner wrench (Tool 386), then offer the spanner/multiplier over the immobilizer. Turn the HP rotor shaft as necessary to engage the spanner pin in the cut-away in the steady and the spanner dogs in the retaining nut. Using a torquemeter wrench

(Tool 1656) in the multiplier, torque-tighten the 'LEFT-HAND' threaded retaining nut to 1250 lb ft (1694,8 N.m) (reading of 50 lb ft (67,8 N.m) on the wrench because of the 25 to 1 multiplier). Remove the torque-meter wrench, multiplier/spanner, immobilizer and steady from the assembly.

- (11) Assemble the steady, support and immobilizer to the LP drive shaft and the front bearing adapter (Ref. Fig.112).
- (a) Offer the immobilizer (Tool 1339) into the front bearing adapter and engage the teeth in the HP drive shaft front retaining nut.
 - (b) Unscrew the knurled locknut, then withdraw the location bush towards the eye-end of the steady (Tool 290). Offer the steady shaft to the LP drive shaft and slide the four lobes of the steady shaft through the four cut-aways in the drive shaft, then turn the steady shaft 45 deg so that the lobes locate behind the lands of the drive shaft. Push the location bush down, locating it over the drive shaft and ensuring that its peg locates in one of the cut-aways in the steady shaft. Screw on the knurled locknut and tighten it against the location bush.
 - (c) Offer the front support (Tool 292) over the steady, then withdraw the immobilizer from the (rotor drive shaft) nut, align the immobilizer pins and threaded studs with the plain holes in the front support then engage the two. Screw knurled nuts (Tool 1340) onto the protruding end of the studs until the immobilizer is held against the support.
 - (d) Push the support onto the steady and screw the support locknut onto the steady. Align the offset screw of the support with the offset tapped hole in the front bearing adapter, then screw the screws into the adapter ensuring that the support locknut is screwed fully into the steady. Release the support locknut to allow a 0.005 in. (0,127 mm) clearance between the nut and the support, then screw the steady locking nut (Tool 291) onto the end of the steady and lock it against the support locknut.

OVERHAUL

(12) Assemble and secure protector (Tool 395) to the blow-off position at stage 3 location, and protector (Tool 394) to the vent position at stage 5 location of the compressor front case.

B. Assemble the HP Turbine Assembly to the HP Compressor Assembly.

NOTE: The HP turbine assembly must be obtained from engine bulk disassembly. The turbine wheel will be bladed with the blades correctly locked, and the hub unit (72-51-03/1-200) will have the front labyrinth (72-51-03/1-160) assembled to it, whilst the rear labyrinth will be loose. The labyrinths, hub and blade tips will have protectors assembled.

(1) Prepare the HP compressor assembly.

- (a) Release and remove the three knurled nuts (Tool 1340) from the front support (Tool 292) (Ref. Fig.113) releasing the immobilizer (Tool 1339), then push the three studs of the immobilizer to engage the immobilizer in the teeth of the HP drive shaft front retaining nut, turning the rotor (slightly) to achieve engagement. Screw three knurled headed bolts (Tool 1341) into the three tapped holes in the front support to secure the immobilizer in engagement with the retaining nut.
- (b) Turn the stand arms 180 deg to position the rear bearing adapter uppermost.
- (c) Unscrew and remove the LP drive shaft support sleeve (Tool 1030) from the HP drive shaft, then release the mechanical jack (Tool 1029) lock-ring and unscrew the jack a turn. Unscrew the jack captive bolts, then remove the jack (Ref. Fig.102).
- (d) Withdraw the HP drive shaft support sleeve (Tool 1031) from the shaft, then unscrew and remove the guide sleeve (Tool 377) from the end of the LP drive shaft.

DISASSEMBLY

72-33-00

Page 123

Jun 30/01

MK.610-14-28

OVERHAUL

(2) Assemble the HP turbine assembly (Ref.Fig.113 and 114).

- (a) Slide a slave adjusting washer (72-51-04/1-40) over the LP and HP drive shafts and rest it on the bearing. Slide the HP front labyrinth and hub assembly over the LP drive shaft, align the master serration of the hub and the HP drive shaft, then engage the two. Apply lubricant 'B' to the round nut (72-51-04/1-10), then assemble the keywasher (72-51-04/1-30), plain washer (72-51-04/1-20) and round nut to the HP drive shaft.
- (b) Locate the adapter (Tool 1315) on the dowels of the immobilizer (Tool 1343) then secure the adapter to the immobilizer with five cap screws (of the immobilizer). Locate the multiplier (Tool 1022) on the end of the immobilizer, align the holes of both items, then secure them together with eight cap screws (of the immobilizer).
- (c) Slide the spanner wrench (Tool 1085) over the LP drive shaft and engage it in the hub nut. Attach a hoist to the handle of the immobilizer, then raise the hoist and position and lower it over the LP drive shaft. Turn the drive of the multiplier as necessary to engage its square drive in the spanner, and the adapter serrations on those of the hub. Unscrew and remove the lifting ring from the side of the immobilizer, then ensuring that the painted instructions on the arm are uppermost. Lower the torque loading arm (Tool 1342) over the immobilizer and locate the clearance holes over the pillars.
- (d) Unscrew the three knurled headed bolts (Tool 1341) located in the front support, allowing the immobilizer to drop and release the rotor. Turn the rotor to align the datum bolt hole in the labyrinth hub with the cut-away in the rear bearing adapter. Examine the heads of the turbine bolts (72-51-04/1-180) for the position numbers, then insert No.1 bolt through the labyrinth/hub, adapter, immobilizer and arm and secure with a slave nut lubricated with lubricant 'B' (Ref.72-09-00 Assembly). Insert the remaining nine bolts in numerical sequence in a clockwise direction (as viewed from the

OVERHAUL

rear), by turning the rotor to align the holes with the cut-away, and secure with slave nuts.

NOTE: If the protector on the hub prevents the insertion of the turbine bolts, release and remove the protector.

- (e) Turn the stand arms 90 deg to position the HP compressor horizontal in its correct attitude. Looking from the rear of the assembly turn the arm so that it is horizontal, with the painted instruction dealing with the spring balance on the right-hand side. Engage the immobilizer (Tool 1339) in the HP drive shaft front retaining nut and secure with the three knurled headed bolts (Tool 1341). Fully tighten the turbine bolt nuts.
- (f) Attach a spring balance (capable of a load of 200 lb (90,7 kg) to a hoist, then attach the balance to the shackle on the right-hand end of the arm. Hook the weights carrier (Tool 1344) to the shackle at the left-hand end of the arm, then add the five weights (Tool 1345) (totalling 165 lb) to the carrier, ensuring that as the weights are added, an equal load is applied by the hoist, until the total weight of 170 lb (77,11 kg) on one end of the arm, is equalled by load of 170 lb (77,11 kg) on the scale at the other end of the arm.
- (g) Using the torque-meter wrench (Tool 1658) in the multiplier, torque-tighten the retaining nut between 3000 and 3300 lbf ft (4067,5 and 4474,2 N.m) (reading of 120 to 130 lbf ft (162,8 and 176,2 N.m)) on the wrench because of the 25 to 1 multiplier). Remove the wrench, then remove the weights and reduce the load on the spring balance an equivalent amount, until all the weights are removed and the spring balance reads zero. Disconnect the spring balance from the arm and hoist, and the weight carrier from the other end of the arm.
- (h) Turn the stand arms 90 deg to position the rear bearing adapter uppermost. Release the turbine bolt nuts, then unscrew the three knurled headed bolts (Tool 1341) located in the front support, allowing the immobilizer to drop and release the rotor. Turning the rotor as necessary to align the turbine bolts with the

OVERHAUL

rear bearing adapter cut-away, release and remove the turbine bolts. Remove the torque-loading arm from the immobiliser, then screw the lifting ring into the side of the immobiliser. Attach a hoist to the handle of the immobiliser, then raise the hoist and position and lower the immobiliser onto a suitable container. Release the hoist from the immobiliser. Remove the spanner wrench from the hub nut.

- (j) Assemble the lifting fixture (Tool 1120) to the HP turbine unit (Ref.Fig.114).
- (i) Ensure that the thumbnuts are loose and the tommy bars of the claws point to the 'UNLOCK' position.
- (ii) Attach a hoist to the lifting ring of the fixture, then position and lower the fixture into the centre of the turbine wheel, ensuring that the rear of the turbine is uppermost as denoted by the blade locking plates. Turn the tommy bars of the claws to the 'LOCK' position, then lock the claws with the thumbnuts.
- (k) Determine the datum hole of the hub by examining the face of the outside circumference in line with a Hirth serration for a datum mark $\downarrow \bigcirc$. This mark will be in line with a datum mark \downarrow on the rear face of the front labyrinth. Then determine the datum hole in the turbine wheel by examining the outer face of the bolt bosses on the rear (uppermost) face of the wheel for a datum mark $\rightarrow \bigcirc$. Note the position of the datum hole in each item.
- (l) Raise the hoist and position and lower the turbine wheel over the LP drive shaft. Align the datum holes, then lower the wheel onto the hub engaging the Hirth serrations. Release the thumbnuts of the lifting fixture, then turn the tommy bars to the 'UNLOCK' position. Raise the hoist, then position and lower the fixture onto a suitable container and disconnect the hoist.
- (m) Examine the rear ring labyrinth seal (72-51-04/1-160A) rear face, inboard of the attachment bolt holes, for a datum mark $\rightarrow \bigcirc$ indicating the datum hole. Offer the rear labyrinth over the

lp drive shaft, align the datum holes of the labyrinth and turbine wheel, then rest the labyrinth on the wheel. Turn the rotor to align the datum bolt hole in the labyrinth/hub with the cut-away in the rear bearing adapter. Examine the heads of the turbine bolts (72-51-04/1-180B) for the position numbers, then insert No.1 bolt through the labyrinth/hub, turbine wheel and rear labyrinth and secure with a self-locking nut (72-51-04/1-120A) lubricated with lubricant 'B'. Insert the remaining nine bolts in numerical sequence in a clockwise direction (as viewed from the rear) by turning the rotor to align the bolt holes with the cut-away, and secure the bolts with the nuts, having lubricated them with lubricant 'B'.

- (n) Engage the immobilizer (Tool 1339) in the HP drive shaft front retaining nut and secure by screwing in the three knurled headed bolts (Tool 1341). Tighten the turbine wheel nuts in the following sequence 1, 6, 3, 8, 2, 7, 4, 9, 5 and 10 in progressive increments to a final torque between 80 and 90 lbf ft (108,5 and 122,0 N.m).
- (p) Assemble the split sleeve (Tool 393) to the LP drive shaft and HP turbine rear labyrinth. If the balance is not to be carried out immediately, ensure that the protector (Tool 1062) is assembled to the hub labyrinth, and the protectors (Tool 1061, 1063 and 1126) are assembled to the turbine front and rear labyrinths and the turbine blades.

NOTE: The HP compressor and turbine assembly is now ready for balancing and for concentricity and swash checks.

C. Prepare the Balancing Machine (Avery 72N56)(Ref.Fig.115).

- (1) Assemble a spacer (Tool 1075) to the left-hand and centre cradles of the machine, and spacer (Tool 1074) to the right-hand cradle. Assemble clamp plates to each cradle to secure the spacers.
- (2) Assemble the adjustable support (Tool 1090) to the spacer in the left-hand cradle so that the hinged bridge piece opens away from the operator. Assemble clamp plates to the spacer to secure the support, then open the bridge piece. Ensure that the three support pads are withdrawn.

- (3) Assemble and (temporarily) secure two brackets (Tool 1291) to the bed of the machine in between the left-hand and centre cradles. Position the bottom half of the turbine guard (Tool 1303) on the two brackets, then locate the bracket/guard securing studs in the slots in the guard brackets and secure with washers and nuts.

D. Assemble the HP Compressor and Turbine Assembly to the Balancing Machine (Ref.Fig.115).

- (1) Rotate the pit stand arms 90 deg with the lifting eyes on the front and rear adapters uppermost. Attach a hoist to the roller of the beam type sling (Tool 1056) (Ref.Fig.116), then raise the hoist and position the beam over the HP compressor assembly. Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. Attach the strop/sling to the rear bearing adapter eye and the front bearing adapter plate with the shackles. Position the beam lifting roller towards the turbine wheel end of the beam, or as marked on the beam.
- (2) Raise the hoist to tension the strop/sling, then unscrew and remove the nuts and washers securing the adapter to the pit stand arms. Adjust the position of the beam lifting roller to support the assembly in the horizontal position. Traverse the hoist to disengage the adapter from the locating pins of the arms. Raise the hoist taking care to guide the assembly out of the stand.

NOTE: If the HP compressor is to be assembled direct to the balancing machine by hoist proceed as detailed in para.(8) onwards. If, however, the availability of the balancing machine entails a delay before the HP compressor is balanced, but the pit stand is required for other use, or the position or availability of equipment prevents the HP compressor from being assembled direct to the machine, the HP compressor can be assembled to the mobile stand or support stands as follows (Ref.Fig. 116).

DISASSEMBLY
72-33-00

Page 131
Aug 27/75

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (3) Position the assembly over the front support (Tool 1076) and rear support (Tool 1306), then lower the assembly engaging the front bearing support lugs in the front support and the recessed part of the rear bearing adapter in the rear support. If the assembly has to remain on the support stands for a period, or has to be assembled to the mobile stand, release the beam type sling and lower it to the floor.

NOTE: When the assembly is required for assembling to the balancing machine, remove it from the supports and assemble it to the machine as detailed in para.(6) onwards.

NOTE: If the assembly requires transporting in the mobile stand, assemble it to the stand as detailed in para.(4).

- (4) Close and secure the front support locking bars, then screw the lifting fixture (Tool 1055) onto the end of the LP drive shaft and attach a hoist to the fixture. Moving the hoist as necessary, raise the rear end of the assembly, pivoting about the front support, until the assembly is vertical. Release the front support locking bars, then raise the hoist and position it over the mobile stand (Tool 1036). Ensure that the stand clamps are clear, align the lifting eye and attachment nuts of the adapter with the stand cut-aways, then lower the assembly onto the stand. Secure the adapter to the stand with the stand clamps. Release the hoist.

NOTE: When the assembly is required for assembling to the balancing machine, remove it from the mobile stand and assemble it to the machine as detailed in para.(5) onwards.

- (5) Attach a hoist to the lifting fixture, then release the mobile stand clamps and raise the hoist and position the assembly over the front support (Tool 1076). Lower the assembly engaging the lugs of the front bearing support in the front support, then close and secure the front support locking bars. Moving the hoist as necessary, lower the rear end of the assembly, pivoting about the support, and rest the recessed part of the rear bearing adapter on the rear support (Tool 1306), ensuring that the lifting eye and plate of the adapters are uppermost. Release

the hoist, then unscrew and remove the lifting fixture from the LP drive shaft.

CAUTION: ENSURE THAT THE LIFTING FIXTURE (TOOL 1055) PLATE PIVOTS AS THE ASSEMBLY IS LOWERED.

- (6) Attach a hoist to the roller of the beam type sling (Tool 1056) then raise the hoist and position the beam over the HP compressor. Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. With the shackles remove from the bottom of the strop and single leg sling, attach the strop/sling to the rear bearing adapter eye, and the front bearing adapter plate with the shackles. Position the beam lifting roller towards the turbine wheel end of the beam, or as marked on the beam.
- (7) Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position.
- (8) Remove the protectors (if assembled) from the hub labyrinth, turbine front and rear labyrinths and turbine blade tips.
- (9) Position the assembly over the balancing machine with the front bearing adapter at the right-hand side (Ref. Fig.115). Position the balancing machine cradles to align with the recessed portion in each adapter and the plain portion of the LP drive shaft, then lock the cradles. Release the guard brackets, then position the guard and brackets to align with the turbine wheel. Secure the brackets and guard. Steadily lower the assembly and guide the adapter recesses onto the cradle spacers, then assemble clamp plates to each spacer to secure the adapters. Close and secure the bridge piece, then adjust in on the three support pads until they abut the LP drive shaft. Lock the support pads with their locknuts. Release and remove the beam type sling from the HP compressor, then position and lower the sling onto a suitable surface and disconnect the hoist.

NOTE: Unless already indicated, it is recommended that the beam type sling is painted to indicate the position the lifting roller should be in with the HP turbine assembled, and which end of the beam is positioned over which adapter.

OVERHAUL

- (10) Align the balancing machine motor and rollers with the belt protruding from the cut-away of the rear bearing adapter, assemble the belt to the motor/rollers and adjust as necessary to operate correctly, then secure the motor/rollers.
- (11) Attach a strip of black adhesive tape around the HP drive shaft, clear of the belt, but within the area of the cut-away in the rear bearing adapter. Mark the adhesive tape with a white spot in line with the datum bolt hole of the turbine wheel (Ref. para. B. (2), (k)), and chalk mark a line on the drive shaft which must remain for future use. Use the spot as the datum for balancing.
- (12) Assemble a tie bar (Tool 1292) to the front face of the left-hand and centre cradle of the balancing machine, and secure with four bolts or Allen screws, then secure a tie bar (Tool 1293) to the rear face of the left-hand and centre cradle.
- (13) Release and remove the split sleeves from the LP drive shaft, then using a hoist, assemble and secure the top half of the turbine guard (Tool 1303) to the bottom half of the guard.
- (14) Unscrew and remove the three knurled headed bolts (Tool 1341) securing the immobilizer (Tool 1339) in engagement with the HP drive shaft front retaining nut, then screw the three knurled headed nuts (Tool 1340) onto the protruding ends of the immobilizer studs. Fully tighten the nuts to hold the immobilizer out of engagement with the retaining nut and permit the HP compressor and turbine to turn.
- (15) Prepare the balancing machine for balancing in accordance with the manufacturers instructions, setting up the pick-ups, nodel bar, pick-up wires and scanning head etc.
- E. Check Balance of HP Compressor Rotor and Turbine Assembly (Ref. Fig. 117).
- (1) Start the balancing machine and run the assembly up to balancing speed in accordance with the manufacturers instructions.

NOTE: 1 drm in. = 45 g mm.

DISASSEMBLY

72-33-00

Page 135
Apr 1/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Allow the assembly to rotate long enough to eliminate the effects of differential temperature on the readings obtained, then calibrate the machine and continue to rotate the assembly until the change in the mean average readings of unbalance at F and T3 over a period of three minutes are less than 2 drm in.
- (3) Calibration checks.
 - (a) The application of 4 drms of plasticine to the HP drive shaft 9 in. (228,6 mm) rearward of Rc should register approximately 9 drm in. at F and 33 drm in. at Rc 180 deg from the reading at F.
- (4) Record the 'as received' amount and angle of unbalance at F and T3.
- (5) Remove the balance weights at T3.
- (6) Rotate the assembly and record the amount and angle of unbalance at F and T3.
- (7)
 - (a) Changes of unbalance within the limits of 150 drm in. at F and 80 drm in. at T3 proceed to para.5.A.
 - (b) Changes in excess of limits quoted are to be investigated.

4. Prepare and Check the Concentricity and Swash of the HP Compressor and Turbine Assembly

- A. Prepare the Surface Table Equipment for Checking the Concentricity and Swash (Ref.Fig.118).

NOTE: If the availability of equipment entails using the spacers used for the balancing, remove the HP compressor from the balancing machine and place on the support stands (Ref.para.B. (1) to (4) and para.3.D. (3) to (8)), then release and remove the spacers from the machine and assemble the spacers to the surface table.

- (1) Position two supports (Tool 1073) on the surface table.
- (2) Assemble a spacer (Tool 1074) to one support and spacer (Tool 1075) to the remaining support. Assemble clamp plates to each support to secure the spacers.
- (3) Position the jack (Tool 1059) on the surface table.

OVERHAUL

B. Remove the HP Compressor and Turbine Assembly from the Balancing Machine and Assemble to the Surface Table.

- (1) Remove the top half of the guard (if assembled) from around the turbine wheel, then assemble the split sleeves (Tool 393) to the LP drive shaft and HP turbine rear labyrinth. Release and hinge open the bridge piece of the adjustable support (Ref.Fig.115).
- (2) Release and remove the drive belt from the motor and rollers, and secure the belt clear of the machine to prevent possible fouling. Remove the black adhesive tape from the HP drive shaft.
- (3) Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor. Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. Attach the strop/sling to the rear bearing adapter eye and the front bearing adapter plate with the shackles. Position the beam lifting roller towards the turbine wheel end of the beam, or as marked on the beam.
- (4) Release and remove the clamp plates from the spacers. Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position. Steadily raise the hoist until the HP compressor is clear of the balancing machine.

NOTE: If the availability of the surface table entails a delay before the HP compressor can be assembled to the table, but the balancing machine is required for other use, or the position or availability of equipment prevents the HP compressor from being assembled direct to the table, the HP compressor can be assembled to the mobile or support stands as detailed in para.3.D. (3) to (8).
- (5) Position the HP compressor over the surface table. Ensure that the supports on the surface table are aligned with the recessed portion in each adapter, and that the supports are secured to the surface table. With the front bearing adapter located over the spacer (Tool 1074), lower the assembly and guide the adapter recesses onto the spacers, then assemble clamp plates to each spacer to secure the adapters. Release and remove the beam type sling from the adapters, then

lower the beam onto a suitable container and release the hoist. Position the jack (Tool 1059) under the LP drive shaft, at a plain portion of the shaft, then adjust in on the three support pads until they abut the shaft. Release and remove the split sleeves (Tool 393) from the LP drive shaft turbine labyrinth.

C. Check the Concentricity and Swash of the HP Compressor and Turbine Assembly (Ref.Fig.119).

- (1) The procedure for checking the swash and concentricity is as follows.
 - (a) Remove the access panels from the front bearing adapter to check the positions at the front end of the rotor, and the large access panel from the rear bearing adapter to check the positions at the rear end of the rotor.
 - (b) Select suitable surface blocks, stands and dial gauge equipment for the position to be checked, then engage the dial gauge with the item, ensuring that the gauge is in its mid travel position, and where possible, engaged at the top vertical position.
 - (c) Identify the datum bolt hole of the HP turbine wheel (Ref.para.3.D.(11)) by the chalk mark on the shaft. Use the datum mark as the common angular datum line.
 - (d) Turn the rotor to position the datum line at the top vertical position; then position and lock the dial gauge scale to (zero) '0'.
 - (e) Turn the rotor in a clockwise direction as viewed from the rear, and record the swash or eccentricity at eight equi-spaced angular positions. Ensure that when the rotor returns to its starting point, the gauge returns to '0'. If the gauge does not return to '0', check the equipment to ensure there is no looseness and that the gauge is locked, then recheck until a satisfactory result is achieved.
 - (f) When swash checks entail the dial gauge pointer passing over blade roots, care must be taken to ensure that the gauge setting is not altered.

OVERHAUL

- (g) On completion of the checks replace and secure the panels.
- (2) Check and record the amount of swash and eccentricity as detailed in para.(1) at the following positions.
 - (a) The eccentricity at the rear land of the rear (No.12) labyrinth (position Y2).
 - (b) The eccentricity at the mid position of the HP drive shaft (position Y3).
 - (c) The eccentricity at the rear end of the HP drive shaft (position Y4).
 - (d) The swash at the stage 7 disk at the blade root location (position V2).
 - (e) The swash at the rear land of the rear (No.12) labyrinth (location V3).
 - (f) The swash at the stage 1 disk at the blade root (position V1).
 - (g) The eccentricity at the stage 1 disk at the blade lip (position Y1).
- (3) The eccentricity at position Z1 and Z2 as follows.
 - (a) Remove the rear bolt and spacer from the bolted vane at the top of the compressor case at the stage 3 vane location.
 - (b) Remove the checking gauge (Tool 1) from its container (Tool 90) and slide the probe out of the sleeve. Ensure that a slave washer is assembled to the sleeve, then screw the sleeve into the hole in the case and fully tighten the sleeve.
 - (c) Insert the probe into the sleeve, then insert the dial gauge indicator into the sleeve and secure it in the sleeve with the wing screw, ensuring that the gauge is in its mid travel position.
 - (d) Check the amount of eccentricity at stage 3-4 spacer ring (position Z1) as detailed in para.(1), (c) to (e).

IN27388

DISASSEMBLY

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (e) Release and remove the dial gauge indicator, then unscrew and remove the gauge sleeve and washer. Stow the gauge in its container. With the sleeve (2-20) assembled to the bolt (2-10) screw the bolt into the case and torque-tighten the bolt between 60 and 65 lbf in. (6,8 and 7,3 N.m). Wire-lock the bolt to the other stator vane securing bolt.
- (f) Check the amount of eccentricity at stage 4-5 spacer ring (position Z2) by removing the rear bolt and spacer from the bolted vane at the left-hand side of the compressor case at the stage 4 vane location. Using the check gauge (Tool 2) follow the procedure as detailed in para.(b) to (d).
- (4) Measure swash of the HP turbine wheel, front face at position V4 and rear face at position W (Ref.Fig.119).
- (a) The checks entail the use of two dial gauges, for each face, and readings are taken simultaneously at the left and right-hand sides of the wheel.
- NOTE: Before carrying out swash checks it is recommended that both front and rear faces are chalked up as in Fig.119, using the wheel datum as zero.
- (b) Swash at rear face, position W.
- (i) With both dial gauges set to zero, and each positioned at its own wheel zero turn the wheel counter-clockwise, looking from the rear and record both dial readings at each of the eight angular positions. Ensure that on returning to the start position both gauges again read zero.
- (ii) For each gauge add the two largest readings to record the maximum TIR and angle.
- (iii) Total swash for rear face is recorded as the mean average of TIR readings from left and right-hand gauges and at the mean average of both angles.
- (c) Swash at front face, position V4, repeat the procedure described for position W.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (d) Should the TIR of swash be greater than 0.005 in. (0,127 mm) remove the HP turbine assembly from the HP compressor assembly (ref.para.D) and carry out an investigation.
 - (5) The total indicator reading (TIR) of swash at positions V1, V2, V3, V4 and W should not exceed 0.005 in. (0,127 mm). Amounts of eccentricity can be compared with those recorded at engine build and should be in the region of 0.004 in. (0,1016 mm) maximum.
 - (6) Assemble the split sleeves (Tool 393) to the LP drive shaft and HP turbine rear labyrinth.
- D. Remove the HP Compressor and Turbine Assembly from the Surface Table.
- (1) Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor. Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. Remove the shackles from the bottom of the strop and single leg sling, then attach the strop/sling to the rear bearing adapter eye, and the front bearing adapter plate with the shackles (Ref.Fig.116). Position the beam lifting roller towards the turbine wheel end of the beam, or as marked on the beam.
 - (2) Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position.

NOTE: If the availability of the pit stand or its position prevents the HP compressor from being assembled direct (by hoist) into the stand (Ref.para. (3) and (4)), assemble it to the mobile stand as detailed in para.3. D. (3) to (8), then assemble it to the pit stand.

OVERHAUL

- (3) Position the assembly above the pit stand (Tool 1027). Position the pit stand arms so that the locating pins/studs are at 90 deg to the vertical, then lower the compressor into the stand so that the front face of the rear bearing adapter flange faces the pins/studs and is level with them. Traverse the hoist and engage the pins/studs into the extensions of the adapter flange, then assemble and fully tighten a washer and nut to each of the studs.
- (4) Release and remove the beam type sling from the adapters, then lower the beam onto a suitable container and release the hoist. Rotate the pit stand arms 90 deg to position the rear bearing adapter uppermost.

5. Remove the HP Turbine Assembly from the HP Compressor Assembly

A. Remove the Rear Labyrinth from the HP Turbine Disk (Ref. Fig.120).

- (1) Release and remove the protector (Tool 1062) from the hub labyrinth (if assembled) then unscrew and remove the 10 nuts securing the labyrinth to the turbine disk and lower the bolts onto the rear bearing adapter flange. Release and remove the split steady (Tool 393) from the labyrinth and the LP drive shaft.
- (2) Ensure that the tommy bars of the mechanical puller (Tool 1247) are turned to 'FREE' and the thrust bolts are unscrewed.
- (3) Offer the puller over the LP drive shaft and guide the claws through the air holes in the labyrinth. Turn the claw tommy bars to 'LOCK', then screw in on the three thrust bolts until they contact the disk. Screw the thrust bolts in, in equal increments, until the labyrinth is released.
- (4) Withdraw the labyrinth/puller over the LP drive shaft and place them on a clean flat surface. Turn the claw tommy bars to 'FREE' and remove the puller from the labyrinth.

B. Remove the HP Turbine Wheel from the Hub/Labyrinth Unit
(Ref. Fig.121).

- (1) Ensure that the lifting fixture (Tool 1120) thumbnuts are undone, that the claws are pushed out and the claw tommy bars point to 'UNLOCK'.
- (2) Attach a hoist to the lifting fixture, then lower the fixture over the LP drive shaft and guide the bottom locating ring into the centre hole of the disk, until the top locating ring abuts the disk.
- (3) Turn the tommy bars to 'LOCK' adjusting their position as required to locate them under the disk, then tighten the thumbnuts to lock the claws.
- (4) Steadily raise the turbine disk until clear of the LP drive shaft, then position and lower it onto a suitable pallet (Ref. para.5) or onto its mobile stand (Tool 1111) as follows.
 - (a) Ensure that the mandrel (Tool 139) is assembled to the pivoting bearing side of the mobile stand, with the mandrel secured in the vertical position and the Hirth serrations uppermost. Remove the pin and lower the other side of the stand.
 - (b) Position the disk over the mandrel, then lower the hoist and guide the disk over the mandrel and engage the mandrel studs in the bolt holes of the disk. Screw the special nuts onto the studs and fully tighten the nuts. Screw the lifting fixture (Tool 1113) into the (top) end of the mandrel.
 - (c) Release the lifting equipment thumbnuts, then turn the claw tommy bars to 'UNLOCK'. Steadily raise the hoist until the fixture is clear of the mandrel, then lower the fixture onto a suitable container and remove the hoist.
 - (d) Attach the hoist to the lifting fixture of the mandrel, then withdraw the plunger from the bearing. Lower the hoist and pivot the mandrel about the bearing until the mandrel is nearly horizontal. Raise the side of the stand and lock it with the pin, then lower the lifting fixture end of the mandrel and locate it in the other bearing. Pivot the bearing cap over the mandrel and secure the cap with its pivot bolt and thumbnut. Push in the plunger on the other bearing. Release and remove the hoist.

OVERHAUL

- (5) If the turbine disk was placed on a pallet, release the lifting fixture thumbnuts, turn the claw Tommy bars to 'UNLOCK', taking the weight of the disk as required to disengage the claws from under the disk, then withdraw the fixture from the disk. Remove the fixture from the disk and place it on a suitable container.
- C. Remove the HP Turbine Front Labyrinth and Hub Assembly from the HP Drive Shaft (Ref.Fig.122).
- (1) Ensure that the adapter (Tool 1315) is located and secured to the plate of the immobilizer (Tool 1343) and the multiplier (Tool 1022) is secured to the handle end of the immobilizer.
- (2) Lower the spanner wrench (Tool 1085) over the LP drive shaft and locate it in the retaining nut. Attach a hoist to the handle of the immobilizer (Tool 1022), then lower the immobilizer over the spanner and turn the multiplier drive as necessary to engage it in the spanner and to align the immobilizer pillars with the bolts in the hub. Disconnect the hoist from the handle.
- (3) Push the bolts up through the pillars and screw slave nuts onto the bolts, fully tightening the nuts. Insert a bar into the immobilizer, then unscrew the nut.
- (4) Unscrew and remove the nuts and lower the bolts onto the adapter flange. Attach a hoist to the handle, then steadily raise the hoist until the immobilizer is clear of the spanner. Position and lower the immobilizer onto a suitable container, then disconnect the hoist. Withdraw the spanner from the LP drive shaft and place it on a suitable container.
- (5) Unscrew the hub retaining nut, then remove the nut, plain washer and keywasher from the HP drive shaft.
- (6) Attach a hoist to the extractor/lifting equipment (Tool 1057), then steadily lower the extractor over the LP drive shaft until the cylinder engages in the HP drive shaft. Aligning the pillars with the hub bolts, turn the handle to lower the extractor until it abuts the hub. Push the hub bolts up through the pillars, then screw slave nuts onto the five bolts. Withdraw the remaining five bolts by turning the HP drive shaft, as necessary, to remove the bolts through the cut-away in the rear bearing adapter flange.

OVERHAUL

- (7) Screw in on the extractor handle until the hub/labyrinth is released, then steadily raise the hoist until the hub is clear of the LP drive shaft. Lower the hub onto a clean flat surface. Unscrew and remove the slave nuts, then remove the extractor from the hub and lower it onto a suitable container. Disconnect the hoist.
- (8) Remove the bolts from the hub, then assemble the protector (Tool 1062) to the hub labyrinth.
- (9) Remove the adjusting washer from the HP drive shaft, then place it in a container and retain it with the hub/labyrinth.
- (10) Ensure that the protectors (Tool 1061 and 1063) are assembled to the turbine front and rear labyrinths and the protector (Tool 1126) is assembled to the turbine blades.

NOTE: The HP turbine items should now be transferred to their disassembly section (72-51-03, Disassembly).

- (11) Offer the spacer ring (Tool 414) with its flanged end to the rear (uppermost), over the LP and HP drive shaft and rest it on the bearing inner race. Apply lubricant 'B' to the retaining nut (02/3-10), then screw it onto the HP shaft. Tighten the nut with the hand spanner wrench (Tool 410).
- (12) If the HP compressor is not to be worked on for a period, assemble the split sleeves (Tool 1058) to the HP and LP drive shafts.

6. Prepare and Check Balance of HP Compressor Assembly

A. Prepare the Balancing Machine (Avery 72N56) (Ref.Fig.123).

NOTE: If the equipment was left on the balancing machine following the balance of the HP compressor and turbine assembly, para.A. will not be required, but the bottom half of the turbine guard (Tool 1303) must be released and removed from the balancing machine and the tie bar (Tool 212) from the cradles.

- (1) Assemble a spacer (Tool 1075) to the left-hand and centre cradles of the machine, and spacer (Tool 1074) to the right-hand cradle. Assemble clamp plates to each cradle to secure the spacers.

- (2) Assemble the adjustable support (Tool 1090) to the spacer in the left-hand cradle so that the hinged bridge piece opens away from the operator. Assemble clamp plates to the spacer to secure the support, then open the bridge piece. Ensure that the three support pads are withdrawn.
- B. Assemble the HP Compressor Assembly to the Balancing Machine (Ref.Fig.123).
- (1) Rotate the pit stand arms 90 deg with the lifting eyes on the front and rear bearing adapters uppermost. Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor assembly. Ensure that the strop is shackled to the upper hole in the end plate, then attach the single leg sling (Tool 1394) to the bracket at the other end of the beam with a shackle. Remove the shackles from the bottom of the strop and single leg sling, then attach the strop/sling to the rear bearing adapter eye, and the front bearing adapter plate with the shackles. Position the beam lifting roller to the beam mid position, or as marked on the beam.
- (2) Raise the hoist to tension the strop/sling, then unscrew and remove the nuts and washers securing the adapter to the pit stand arms. Adjust the position of the beam lifting roller to support the assembly in the horizontal position. Traverse the hoist to disengage the adapter from the locating pins of the arms. Raise the hoist taking care to guide the assembly out of the stand.
- (3) Position the assembly over the balancing machine with the front bearing adapter at the right-hand side. Position the balancing machine cradles to align with the recessed portion in each adapter and the plain portion of the LP drive shaft, then lock the cradles. Steadily lower the assembly and guide the adapter recesses onto the cradle spacers, then assemble clamp plates to each spacer to secure the adapters. Close and secure the bridge piece of the adjustable support, then adjust in on the three support pads until they abut the LP drive shaft. Lock the support pads with their locknuts.

DISASSEMBLY

72-33-00

Page 153

OVERHAUL

- (4) Align the balancing machine motor and rollers with the belt protruding from the cut-away of the rear bearing adapter, assemble the belt to the motor/rollers and adjust as necessary to operate correctly, then secure the motor/rollers.
- (5) Attach a strip of black adhesive tape around the HP drive shaft, clear of the belt, but within the area of the cut-away in the rear bearing adapter. Mark this adhesive tape with a white spot in line with the chalk mark on the HP drive shaft denoting the datum hole of the turbine wheel (Ref. para. 4, C. (c)). Use the spot as the datum for balancing.
- (6) Release and remove the split sleeves from the LP drive shaft.
- (7) Prepare the balancing machine for balancing in accordance with the manufacturers instructions, setting up the pick-ups, model bar, pick-up wires and scanning head etc.

C. Check Balance of HP Compressor Rotor (Ref. Fig. 124).

- (1) Start the balancing machine and run the assembly up to balancing speed in accordance with the manufacturers instructions.
- (2) Allow the assembly to rotate long enough to eliminate the effects of differential temperature on the readings obtained, then calibrate the machine and continue to rotate the assembly until the change in the mean average readings of unbalance at F and Rc over a period of three minutes are less than 2 drin in.
- (3) Calibration checks.
 - (a) The application of 4 drms of plasticine to the HP drive shaft 9 in. (228,6 mm) rearward of Rc should register approximately 9 drin in. at F and 33 drin in. at Rc 180 deg from the reading at F.
 - (b) The rotation of the slave distance piece (Tool 414) through 180 deg should not affect balance at Rc by more than 2 drin in.

NOTE: 1 drin in. = 45g mm.

- (4) Record the 'as received' amount and angle of unbalance at F and Rc.
- (5) Unscrew the self-locking nuts and remove the balance weights from F (Ref.Fig.124), then replace and torque-tighten the nuts between 300 and 330 lbf in. (33,9 and 37,3 N.m).
- (6) On Pre SB.72-8305-154 Part 1 standard engines, unlock the tabwashers, remove and discard the balancing bolts (detail Rc).

NOTE: Balancing bolts are lifed at each overhaul strip and must be replaced with new bolts) (Ref.72-33-00 Para.6.c. Sub-Assembly).

- (7) On engines embodying SB.72-8305-154 Part 1 unscrew the nuts from the labyrinth rear flange bolts and remove the balancing weights. Replace the nuts and torque-tighten between 67 and 73 lbf in. (7,6 and 8,3 N.m).

NOTE: Check that the D-headed bolts are assembled correctly. The cross of the letter T marked on the tip of the bolts denotes the position of the D-headed bolt flat (detail Rc).

- (8) Rotate the assembly and record the amount and angle of unbalance at F and Rc.
- (9) A change of unbalance greater than 130 drn in. at Rc is excessive and should be investigated.

D. Remove the HP Compressor Assembly from the Balancing Machine.

- (1) Offer the two halves of the split sleeve (Tool 1058) to the LP drive shaft and locate the ends in the HP drive shaft, then secure the two halves together. Release and hinge open the bridge piece of the adjustable support.
- (2) Release and remove the drive belt from the motor and rollers and secure the belt clear of the machine to prevent possible fouling. Remove the black adhesive tape and chalk mark from the HP drive shaft.
- (3) Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor. Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. Attach the strop/sling to the rear bearing adapter eye and the front bearing adapter plate with the shackles (Ref. Fig.116). Position the beam lifting roller to the beam mid position, or as marked on the beam.

OVERHAUL

- (4) Release and remove the clamp plates from the spacers. Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position. Steadily raise the hoist until the HP compressor is clear of the machine.
- (5) Position the assembly over the front support (Tool 1076) and rear support (Tool 1306), then lower the assembly engaging the front bearing support lugs in the front support and the recessed part of the rear bearing adapter on the rear support.
- (6) Close and secure the front support locking bars, then screw the lifting fixture (Tool 1055) onto the end of the LP drive shaft and attach a hoist to the fixture. Moving the hoist as necessary, raise the rear end of the assembly, pivoting about the front support, until the assembly is vertical. Release the front support locking bars, then raise the hoist and position it over the mobile stand (Tool 1036) (Ref. Fig.125). Ensure that the stand clamps are clear, align the lifting eye and attachment nuts of the adapter with the stand cut-aways, then lower the assembly onto the stand. Secure the adapter to the stand with the stand clamps. Release the hoist.

7. Prepare the HP Compressor Assembly for Disassembly

A. Remove the HP Compressor Rear Labyrinth from the HP Drive Shaft.

- (1) Unscrew and remove the lifting fixture (Tool 1055) from the LP drive shaft, then release and remove the split sleeve (Tool 1058) from the LP and HP drive shafts (Ref.Fig.125).
- (2) Unscrew the bearing retaining nut using the hand spanner (Tool 410), then withdraw the retaining nut and spacer ring (Tool 414) from the HP drive shaft.
- (3) Offer the multiple leg sling (Tool 1054) over the LP and HP drive shaft and align the captive bolts with the tapped holes in the rear (top) flange of the rear bearing adapter. Screw the bolts into the adapter and fully tighten the bolts. Release and remove the slave nuts and bolts securing the rear bearing adapter to the HP rear case.

Printed in England

- (4) Attach a hoist to the ring of the sling, then steadily raise the adapter until clear of the LP drive shaft. Position and lower the adapter onto a suitable pallet. Release the hoist, then release and remove the sling from the adapter.
 - (5) On engines to Pre SB.72-8305-154 Part 1 standard release and remove the nuts, keywashers and flat washers from the rear (top) bolts securing the labyrinth to the HP drive shaft. On engines to SB.72-8305-154 Part 1 standard remove the nuts from the rear (top) bolts securing the labyrinth to the HP drive shaft, remove and discard the bolts. Unscrew and remove the nuts from the front bolts (hidden under the labyrinth) securing the labyrinth to the drive shaft.
 - (6) On engines Pre.SB.0L.72-8305-154, screw pullers (Tool 1668) into the tapped extractor holes in the rear (top) of the labyrinth until they contact the HP drive shaft flange, then screw in the pullers in equal progressive increments until the labyrinth is released.
 - (7) On engines to SB.0L.72-8305-154, install the hydraulic extractor (Tool 3154) and release the labyrinth.
 - (8) Withdraw the labyrinth from the HP drive shaft. Remove (Tool 1668) or (Tool 3154) and bolts from the labyrinth, discard and scrap the bolts then secure the protector (Tool 1239) around the labyrinth. Engines to Pre SB.72-8305 standard unclip the bolt retaining rings, then remove and discard the bolts from the HP drive shaft labyrinth flange
- B. Assemble the Lifting Equipment and Invert the HP Compressor Assembly (Ref.Fig.126).
- (1) Attach the lifting plate of the beam type sling (Tool 1051) to a hoist, then position the hoist over the adapter (Tool 1041). Secure the two whips of the sling to the two lifting plates of the adapter with shackles.

OVERHAUL

- (2) Raise the hoist and position the adapter over the LP drive shaft. Lower the adapter aligning the bolt holes in both flanges, and locate the adapter pin hole over the HP compressor case locating pin. Insert the adapter slave bolts through the case flange and secure with (special) slave nuts. Fully tighten the nuts. Release the sling from the adapter, then remove the sling from the hoist.
- (3) Lower the spacer sleeve (Tool 391) over the LP drive shaft and screw it onto the HP drive shaft. Screw the slave nut (Tool 1042) onto the LP drive shaft and just tighten against the sleeve.
- (4) Lower the lifting fixture (Tool 1043) over the slave nut and screw the fixture onto the extension sleeve until tight. Attach a hoist to the lifting fixture.
- (5) Release the clamps of the mobile stand, raise the hoist until the assembly is clear of the stand, then position the hoist next to another hoist in an area clear of obstruction that will permit the HP compressor to be inverted.

OVERHAUL

- (6) Position the forked end of the lifting fixture (Tool 914) on the eye-end of the steady (Tool 290) protruding out of the front support in the front (bottom) of the assembly, and secure with the special bolt of the fixture. Raise the end of the fixture, ensuring that the right-angled plates abut the edge of the front bearing adapter, then attach a hoist to the fixture.
- (7) Ensure that the lifting fixture attached to the first hoist is aligned with the bottom lifting fixture and that it will pivot correctly, then steadily raise the second hoist and lower the first hoist until the assembly is inverted. Disconnect the first hoist from the lifting fixture.
- (8) Unscrew and remove the lifting fixture (Tool 1043) from the (bottom) end of the spacer sleeve, then unscrew and remove the slave nut from the (bottom) end of the LP drive shaft. Screw the protector (Tool 403) onto the end of the spacer sleeve.
- (9) Ensure that the container (Tool 1050) is positioned in the hole beneath the disassembly stand (Tool 1040), then position and lower the HP compressor into the stand (Ref.Fig.105). Position the stand clamps over the HP case flange, then secure the clamps with the knurled nuts. Position the platforms (Tool 1233) around the stand.
- (10) Disconnect the hoist from the lifting fixture (Tool 914) then release and remove the fixture from the steady.

C. Remove the Front Bearing Adapter from the HP Compressor Assembly.

- (1) Remove the support (Tool 292), steady (Tool 290) and immobilizer (Tool 1339) from the LP drive shaft and the front bearing adapter (Ref. Fig.112).
 - (a) Unscrew and remove the three knurled nuts (Tool 1340) from the immobilizer studs that protrude through the support.
 - (b) Unscrew and remove the steady locking nut (Tool 291) from the steady shaft, then release the knurled screws of the support. Unscrew the knurled ring of the support until the support is released, then withdraw the support disengaging it from the pins of the immobilizer.

DISASSEMBLY

OVERHAUL

- (c) Unscrew the knurled lockring, then withdraw the location bush from the LP drive shaft, turn the shaft to disengage its lobes from behind the LP drive shaft lands, and withdraw the steady shaft from the LP drive shaft. Assemble the knurled lockring and locking nut to the steady shaft.
- (d) Withdraw the immobilizer from the LP drive shaft.
- (2) Remove the retaining nut from the HP rotor shaft front (Ref.Fig.111).
 - (a) Offer the steady (Tool 1158) over the LP drive shaft, align the three captive bolts with the tapped holes in the front bearing adapter, then screw the bolts into the adapter and tighten bolts.
 - (b) Offer the immobilizer (Tool 387) over the LP drive shaft and engage it in the cut-aways inside the HP rotor shaft front.
 - (c) Locate the multiplier (Tool 1022) on the spanner wrench (Tool 386) and screw the spanner captive bolts into the multiplier ensuring the bolts are tight.
 - (d) Offer the spanner/multiplier over the LP drive shaft and immobilizer and engage the multiplier square drive in the immobilizer, then turn the HP rotor shaft as necessary to engage the spanner pin in the cut-away in the steady and the spanner dogs in the retaining nut.
 - (e) Using a wrench in the multiplier release the 'LEFT-HAND' threaded retaining nut.
 - (f) Remove the wrench, multiplier/spanner, immobilizer and steady from the assembly.
 - (g) Unscrew and withdraw the nut and spacer ring (Tool 988) from the rotor shaft front.
- (3) Offer the steady (Tool 288) (Ref.Fig.127) over the LP drive shaft and screw it onto the HP rotor shaft front, then screw the lifting/extracting fixture (Tool 1353) onto the steady. Align the offset thumbscrews of the lifting fixture with the tapped

OVERHAUL

holes in the front bearing adapter, and where possible, screw the thumbscrews into the adapter. Screw the fixture onto the steady until the fixture abuts the adapter, then fully tighten the thumbscrews.

- (4) Unscrew and remove the slave nuts and bolts securing the front bearing adapter to the front flange of the HP front case. Unscrew the lifting/extracting fixture handle and raise the adapter, drawing the slave bearing off the rotor shaft front. When the bearing is released, attach a hoist to the lifting fixture, then steadily raise the hoist and unscrew the lifting fixture handle until it is released from the steady. When the adapter is clear, position and lower it onto a suitable container, then release the hoist. Unscrew and remove the steady (Tool 288) from the rotor shaft front, then offer a protector (Tool 1246) over the LP and HP shafts and rest it on the HP front case flange.

8. Disassemble the HP Compressor Assembly

A. Remove the Stage 1 Bladed Compressor Disk.

NOTE: Remove the protector (Tool 1246) (if assembled) from the HP compressor case front flange.

- (1) Check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8446-172).
- (2) Release the nuts securing the stage 1 disk to the rotor centre front, then using the universal socket wrench (Tool 1522) unscrew and remove the nuts.
- (3) Screw the driver (Tool 1225) onto the end of a stage 1 disk bolt, then drift the bolt out of the disk/rotor centre front. Unscrew the driver from the bolt, then repeat the procedure with the remainder of the bolts. Remove the balancing washers and/or plain washers if SB.72-73 is embodied, from the disk face.
- (4) Assemble the multiple leg sling (Tool 404) to the stage 1 disk (Ref.Fig.128).
 - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
 - (b) Ensure that the three lifting clip chains are positioned in No.1 slot of each plate. Loosen the wingnut on each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.

MK.610-14-28
OVERHAUL

- (c) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep and lifting clips are abutting the blades, secure each clip with its wingnut.
- (5) Steadily raise the hoist until the disk is clear of the LP drive shaft, ensuring that it does not swing causing damage to the blades. Position and lower the disk onto a suitable pallet, then release the sling from the blades and disconnect the hoist from the sling. Assemble the protector/retaining band (Tool 1130) around the tips of the blades.

NOTE: If the assembly is not to be worked on immediately, rest the wooden protector (Tool 1364) on the stage 1 stator vanes.

B. Remove the Stage 1 Stator Vanes from the Front Case (Ref.Fig.129).

NOTE: Remove the protector (Tool 1364) (if assembled) from the stator vanes.

- (1) Release and remove from the outside of the case, the two bolts and spacers securing each of the four bolted and two probe bolted stator vanes to the case.
- (2) Remove the two nuts securing the stator vane retainer to the inner fixing ring, then withdraw the retainer from the bolts.
- (3) Identify the bolted stator vane aligned with the loading (cut-away) slot in the case and the opening in the inner fixing ring, then withdraw the inner end of the vane from the ring, pivoting the vane about its outer end, then withdraw the vane from the case loading slot. Ensure that platforms (Tool 1391) are assembled to containers (Tool 1374), then insert the vane into a platform.
- (4) Ease the remainder of the vanes, in turn, along the slot in the case and inner fixing ring into the loading slots and remove in the same manner as the bolted vane. To assist the movement of the vanes, apply lubricant A to the slot in the case and ring. To enable the last few vanes to be removed, it will be necessary to support and/or move the ring (slightly) up/down, and also to turn it to ensure that the loading slots remain aligned. As the vanes are removed, ensure that they are placed in the platforms in the containers.

- (5) Withdraw the inner fixing ring unit from the case, taking care not to damage the labyrinths of the rotor centre front, then stow the ring in the appropriate slot in the container (Tool 1441).

NOTE: If the assembly is not to be worked on immediately, rest the wooden protector (Tool 1364) on the stage 2 blades.

C. Remove the HP Rotor Shaft Front from the Air Transfer Tube.

- (1) Remove the 20 bolts resting on the rotor shaft front, then unscrew and remove the 10 bolts securing the rotor shaft front to the air transfer tube. Lower the protector (Tool 392) over the shaft and locate it around the labyrinths on the rotor shaft front.
- (2) Unscrew and remove the 24 nuts securing the rotor shaft front to the stage 2 disk/spacer ring using the cranked ring wrench (Tool 1591). Screw the driver (Tool 1225) onto the end of a bolt, then drift the bolt out of the shaft/disk/spacer until released. Unscrew the driver from the bolt, then repeat the procedure with the remainder of the bolts.
- (3) Remove the rotor shaft front from the stage 2 disk using the mechanical puller (Tool 457), slave bolts (Tool 459) and thrust bolts (Tool 458) (Ref.Fig.130).
 - (a) Attach a hoist to the multiple leg sling (Tool 1645) then position the hoist over the puller and secure the sling to the puller eye bolts with the sling shackles.
 - (b) Ensure that the six thrust bolts are screwed into the inner ring of tapped holes (at the plate corners) in the puller from underneath. Position and lower the puller onto the rotor shaft front aligning the inner ring of holes in the puller with bolt holes in the shaft.
 - (c) Insert the eight slave bolts into the bolt holes in the shaft flange and through the puller, then screw the puller hand nuts onto the bolts, ensuring that the flats on the slave bolts locate correctly against the shaft, and the hand nuts are tightened.

OVERHAUL

- (d) Screw in on the six thrust bolts until they contact the disk, then separate the shaft from the disk by screwing in the thrust bolts in equal progressive increments until the items are separated.
- (e) Unscrew the puller hand nuts and remove the slave bolts from the shaft. Raise the hoist until the puller is clear of the LP drive shaft, then position the puller over a suitable surface. Remove the thrust bolts from the puller (if required, to prevent possible damage), then lower the puller. Release and remove the sling from the puller and the hoist.
- (f) Lower the lifting fixture (Tool 388) over the LP drive shaft and screw it onto the end of the rotor shaft front. Attach a hoist to the fixture then raise the shaft until clear of the LP drive shaft. Position and lower the shaft onto a clean flat surface. Disconnect the hoist, then unscrew and remove the lifting fixture from the shaft.

NOTE: The lifting fixture is used to guide the rotor shaft front over the LP drive shaft without causing damage. If the puller (Tool 457) is used as a lifting fixture, damage to the LP drive shaft may occur.

- (g) Remove the hand nut/spindle and clamp plate from the container (Tool 1420), then lower the front end of the rotor shaft front into the container. Assemble the clamp plate to the shaft, then secure it with the hand nut/spindle.
- (4) Lower the steady (Tool 287) over the LP drive shaft and secure it to the air transfer tube with the two captive bolts.

D. Remove the Stage 2 Bladed Compressor Disk and Stator Vanes.

NOTE: Remove the protector (if assembled) from the compressor blades.

- (1) Release the stage 2 disk from the stage 2 - 3 spacer ring using the mechanical puller (Tool 461) and claws (Tool 462) (Ref.Fig. 131).

- (a) Attach a hoist to the multiple leg sling (Tool 1645), then position the hoist over the puller and secure the sling to the puller eye bolts with the sling shackles.
 - (b) Position and lower the puller into the case, align the puller thrust pins with the bolt holes in the disk, then lower the pins into the bolt holes and rest the pins on the disk below.
 - (c) Evenly space the three claws around the puller and engage the two pins of each claw in the recess in the top plate of the puller, and the hooked end of the claws around the bottom lip of the disk. If the claws will not go under the disk, unscrew the jack screws in the top plate to lower the claws. With the claws under the disk, screw in on the jack screws to engage them behind the lip, then tighten the hand knob of each claw.
 - (d) Screw the jack screws into the plate in equal progressive increments until the disk is released from the spacer ring.
 - (e) Unscrew the jack screws, then release the claw hand knobs. Remove the claws by disengaging them from under the disk and withdrawing them from the top plate.
 - (f) Raise the hoist until the puller is clear of the LP drive shaft, then position and lower the puller onto a suitable surface. Disconnect the sling from the hoist, then release and remove the sling from the puller.
- (2) Assemble the multiple leg sling (Tool 404) to the stage 2 disk (Ref.Fig.128).
- (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
 - (b) Ensure that the three lifting clip chains are positioned in No.2 slot of each plate. Loosen the wingnut on each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.

E. Remove the Stage 2 - 3 Spacer Ring, Stage 3 Bladed Compressor Disk and Stator Vanes.

- (1) Unscrew and remove the 36 nuts securing the stage 2 - 3 spacer ring to the stage 3 disk using the cranked ring wrench (Tool 1591). Screw the driver (Tool 1225) onto the end of a bolt, then drift the bolt out of the spacer/disk/spacer until released. Unscrew the driver from the bolt, then repeat the procedure with the remainder of the bolts.
- (2) Remove the stage 2 - 3 spacer ring from the stage 3 disk using the mechanical puller (Tool 457), slave bolts (Tool 460) and thrust bolts (Tool 458) (Ref.Fig. 132).
 - (a) Attach a hoist to the multiple leg sling (Tool 1645) then position the hoist over the puller and secure the sling to the puller eye bolts with the sling shackles.
 - (b) Ensure that the six thrust bolts are screwed into the outer ring of tapped holes (at the plate corners) in the puller from underneath. Position and lower the puller onto the spacer aligning the outer ring of holes in the puller with the bolt holes in the spacer.
 - (c) Insert the eight slave bolts into the bolt holes in the spacer flange and through the puller, then screw the puller hand nuts onto the bolts, ensuring that the flats on the bolts locate correctly against the spacer, and the hand nuts are tightened.
 - (d) Screw in on the six thrust bolts until they contact the disk, then separate the spacer from the disk by screwing in the thrust bolts in equal progressive increments until the items are separated. Raise the hoist until the spacer is clear of the LP drive shaft, then position and lower the spacer onto a suitable clean flat surface.

- (e) Unscrew the puller hand nuts and remove the slave bolts from the spacer. Raise the hoist until the spacer is clear, then position the puller over a suitable surface. Remove the thrust bolts from the puller (if required, to prevent possible damage), then lower the puller. Release and remove the sling from the puller and the hoist.
 - (f) Open the protector (Tool 933), position it around the labyrinth on the spacer, then secure the protector with its clamp screw. Stow the spacer in its correct slot in the container (Tool 1441).
- (3) Release the stage 3 disk from the stage 3 - 4 spacer ring using the mechanical puller (Tool 463) and claws (Tool 464) (Ref.Fig.133).

- (a) Assemble a blade retainer (Tool 1166) to each consecutive group of four or five blades until all blades are secured in groups.

NOTE: The blade retainers prevent the blades slipping out of the disk when the disk is raised.

- (b) Attach a hoist to the multiple leg sling (Tool 1645), then position the hoist over the puller and secure the sling to the puller eye-bolts with the sling shackles.
- (c) Position and lower the puller into the case, align the puller thrust pins with the bolt holes in the disk, then lower the pins into the bolt holes and rest the pins on the disk below.
- (d) Evenly space the three claws around the puller and engage the two pins of each claw in the recess in the top plate of the puller, and insert the end of each claw in a cut-away in the disk between the disk and spacer. If the claws are not aligned with the cut-away, unscrew the jack screws in the top plate to lower the claws until they align with the cut-away, then tighten the claw hand knobs to secure the claws in the cut-away.
- (e) Screw the jack screws into the plate in equal progressive increments until the disk is released from the spacer ring.

- (8) Ease the remainder of the vanes, in turn, along the slot in the case and remove in the same manner as the bolted vane. To assist the movement of the vanes, apply lubricant A to the slot in the case. As the vanes are removed, ensure that they are placed in the platform of the containers.

NOTE: If the assembly is not to be worked on immediately, rest the wooden protector (Tool 1361) on the stage 4 blades in the case.

F. Remove the Stage 3 - 4 Spacer Ring, Stage 4 Bladed Compressor Disk and Stator Vanes.

- (1) Unscrew and remove the 36 nuts securing the stage 3 - 4 spacer ring to the stage 4 disk using the cranked ring wrench (Tool 1591). Locate the driver (Tool 1611) over the end of a bolt, then drift the bolt out of the spacer. Repeat the procedure with the remainder of the bolts.

NOTE: Remove the protector (if assembled) from the compressor blades.

- (2) Remove the stage 3 - 4 spacer ring from the stage 4 disk using the mechanical puller (Tool 471), slave bolts (Tool 475) and securing pins (Tool 474) (Ref. Fig.134).
- (a) Attach a hoist to the multiple leg sling (Tool 1645) then position the hoist over the puller and secure the sling to the puller eye bolts with the sling shackles.
- (b) Position and lower the puller into the case, align the puller thrust pins with the bolt holes in the spacer, then lower the pins into the bolt holes and rest the pins on the disk below.
- (c) Insert the eight slave bolts into the bolt holes in the spacer flange (from underneath), then insert the securing pins through the holes in the puller plates and screw the pins onto the slave bolts. Ensure that the flats on the bolts

locate correctly against the spacer, and the pins are tight.

NOTE: If the securing pin holes do not align with the bolt holes in the spacer, turn the puller and locate the puller thrust pins in different holes, until the securing pin holes align with spacer bolt holes. The misalignment will be due to the nine evenly spacer offset bolt holes in the spacer.

- (d) Screw in on the eight jack screws until they contact the lower plate, then separate the spacer from the disk by screwing in the jack screws in equal progressive increments until the items are separated. Raise the hoist until the spacer is clear of the LP drive shaft, then position and lower the spacer onto a suitable clean flat surface.
- (e) Unscrew the securing pins and remove the slave bolts from the spacer. Raise the hoist until the spacer is clear, then position and lower the puller onto a suitable surface. Release and remove the sling from the puller and the hoist. Place the spacer in its correct slot in the container (Tool 1441).
- (3) Release the stage 4 disk from the stage 4 - 5 spacer ring using the mechanical puller (Tool 465) and claws (Tool 466) (Ref.Fig.135).
- (a) Assemble a blade retainer (Tool 1166) to each consecutive group of four or five blades until all blades are secured in groups.

NOTE: The blade retainers prevent the blades slipping out of the disk when the disk is raised.

- (b) Attach a hoist to the multiple leg sling (Tool 1645), then position the hoist over the puller and secure the sling to the puller eye bolts with the sling shackles.
- (c) Position and lower the puller into the case, align the puller thrust pins with the bolt holes in the disk, then lower the pins into the bolt holes and rest the pins on the disk below.

- (d) Evenly space the three claws around the puller and engage the two pins of each claw in the recess in the top plate of the puller, and insert the two ends of each claw in a cut-away in the disk between the disk and spacer. If the claws are not aligned with the cut-aways, unscrew the jack screws in the top plate to lower the claws until they align with the cut-aways, then tighten each claw hand knob to secure each claw end in the cut-aways.
- (e) Screw the jack screws into the plate in equal progressive increments until the disk is released from the spacer ring.
- (f) Unscrew the jack screws, then release the claw hand knobs and withdraw the claws from the disk and the puller.
- (g) Raise the hoist until the puller is clear of the LP drive shaft, then position and lower the puller onto a suitable surface. Disconnect the sling from the hoist, then release and remove the sling from the puller.
- (4) Assemble the multiple leg sling (Tool 404) to the stage 4 disk (Ref.Fig.128).
- (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
- (b) Ensure that the three lifting clip chains are positioned in the outermost slot of each plate. Loosen the wingnut in each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.
- (c) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep and lifting clips are abutting the blades, secure each clip with its wingnut.
- (5) Steadily raise the hoist until the disk is clear of the LP drive shaft, ensuring that it does not swing causing damage to the blades. Position and lower the disk onto a suitable pallet, then release the sling from the blades and disconnect the hoist from the sling. Assemble the protector/retaining band (Tool 1130) around the tips of the blades. Collect the bolts resting on the stage 5 disk and place the bolts in a container.

OVERHAUL

- (6) Release and remove from the outside of the case, the two bolts and spacers securing each of the six bolted stator vanes to the case.
- (7) Identify the bolted stator vane aligned with the loading (cut-aways) slot in the case, then pivot the inner end of the vane upwards and withdraw the outer end of the vane from the case loading slot. Ensure that the platforms (Tool 1390) are assembled to the containers (Tool 1373), then insert the vane into a platform.
- (8) Ease the remainder of the vanes, in turn, along the slot in the case and remove in the same manner as the bolted vane. To assist the movement of the vanes, apply lubricant A to the slot in the case. As the vanes are removed, ensure that they are placed in the platforms of the containers.

NOTE: If the assembly is not to be worked on immediately, rest the wooden protector (Tool 1360) on the stage 5 blades in the case.

G. Remove the Stage 4 - 5 Spacer Ring and Stage 5 Bladed Compressor Disk (Ref.Fig.136).

- (1) Unscrew and remove the 36 nuts securing the stage 4 - 5 spacer ring to the stage 5 disk using the cranked ring wrench (Tool 1591). Locate the driver (Tool 1611) over the end of a bolt, then drift the bolt out of the spacer. Repeat the procedure with the remainder of the bolts.

NOTE: Remove the protector (if assembled) from the compressor blades.

- (2) Remove the stage 4 - 5 spacer ring from the stage 5 disk using the mechanical puller (Tool 472), slave bolts (Tool 475) and securing pins (Tool 474).
 - (a) Attach a hoist to the multiple leg sling (Tool 1645) then position the hoist over the puller and secure the sling to the puller eye-bolts with the sling shackles.
 - (b) Position and lower the puller into the case, align the puller thrust pins with the bolt holes in the spacer, then lower the pins into the bolt holes and rest the pins on the disk below.

- (c) Insert the eight slave bolts into the bolt holes in the spacer flange (from underneath), then insert the securing pins through the holes in the puller plates and screw the pins onto the slave bolts. Ensure that the flats on the bolts locate correctly against the spacer, and the pins are tight.

NOTE: If the securing pin holes do not align with the bolt holes in the spacer, turn the puller and locate the puller thrust pins in different holes, until the securing pin holes align with spacer bolt holes. The misalignment will be due to the nine evenly spaced offset bolt holes in the spacer.

- (d) Screw in on the eight jack screws until they contact the lower plate, then separate the spacer from the disk by screwing in the jack screws in equal progressive increments until the items are separated. Raise the hoist until the spacer is clear of the LP drive shaft, then position and lower the spacer onto a suitable clean flat surface.
- (e) Unscrew the extractor screws and remove the slave bolts from the spacer. Raise the hoist until the spacer is clear, then position and lower the puller onto a suitable surface. Release and remove the sling from the puller and the hoist. Place the spacer in its correct slot in the container (Tool 1441).

- (3) Release the stage 5 disk from the stage 5 - 6 spacer ring using the mechanical puller (Tool 467) and claws (Tool 468) (Ref.Fig.137).

- (a) Assemble a blade retainer (Tool 1166) to each consecutive group of four or five blades until all blades are secured in groups.

NOTE: The blade retainers prevent the blades slipping out of the disk when the disk is raised.

- (b) Attach a hoist to the multiple leg sling (Tool 1645), then position the hoist over the puller and secure the sling to the puller eye bolts with the sling shackles.

- (c) Position and lower the puller into the case, align the puller thrust pins with the holes in the disk, then lower the pins into the bolt holes and rest the pins on the disk below.
 - (d) Evenly space the three claws around the puller and engage the two pins of each claw in the recess in the top plate of the puller and insert the two ends of each claw in a cut-away in the disk between the disk and spacer. If the claws are not aligned with the cut-away, unscrew the jack screws in the top plate to lower the claws until they align with the cut-away, then tighten each claw hand knob to secure each claw end in the cut-away.
 - (e) Screw the jack screws into the plate in equal progressive increments until the disk is released from the spacer ring.
 - (f) Unscrew the jack screws, then release the claw hand knobs and withdraw the claws from the disk and the puller.
 - (g) Raise the hoist until the puller is clear of the LP drive shaft, then position and lower the puller onto a suitable surface. Disconnect the sling from the hoist, then release and remove the sling from the puller.
- (4) Assemble the multiple leg sling (Tool 404) to the stage 5 disk (Ref.Fig.128).
- (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
 - (b) Ensure that the three lifting clip chains are positioned in the outermost slot of each plate. Loosen the wingnut in each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.
 - (c) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep and lifting clips are abutting the blades, secure each clip with its wingnut.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (5) Steadily raise the hoist until the disk is clear of the LP drive shaft, ensuring that it does not swing causing damage to the blades. Position and lower the disk onto a suitable pallet, then release the sling from the blades and disconnect the hoist from the sling. Assemble the blade protector/retaining band (Tool 1130) around the tips of the blades. Collect the bolts resting on the stage 6 disk and place the bolts in a container.

H. Remove the HP Compressor Front Case from the Rear Case.

- (1) Assemble the multiple leg sling (Tool 1053) to the front case.
 - (a) Attach a hoist to the lifting ring of the sling, then position the sling over the front case.
 - (b) Remove the thumbscrews from the attachments brackets, then evenly dispose the three brackets on the front (top) flange of the case and secure them with the thumbscrews.
- (2) Release and remove all nuts, bolts and brackets from the abutment flanges of the compressor front and rear cases. Place the items in suitable containers.
- (3) Steadily raise the hoist until the case is clear of the LP drive shaft, ensuring that the case does not swing causing damage to the stator vanes. Position and lower the case onto a suitable pallet.
- (4) Release and remove the sling from the case and the hoist.

NOTE: If the assembly is not to be worked on immediately, rest the wooden protector (Tool 1359) on the stage 6 blades in the rear case.

J. Remove the Stage 5 - 6 Spacer Ring, Stage 6 Bladed Compressor Disk and Stator Vanes.

- (1) Unscrew and remove the 36 nuts securing the stage 5 - 6 spacer ring to the stage 6 disk using the cranked ring wrench (Tool 1591). Locate the driver (Tool 1611) over the end of the bolt, then drift the bolt out of the spacer. Repeat the procedure with the remainder of the bolts.

NOTE: Remove the protector (if assembled) from the compressor blades.

- (3) Release the stage 6 disk from the stage 6 - 7 spacer ring using the mechanical puller (Tool 469) (Ref.Fig.139).
 - (a) Assemble a blade retainer (Tool 1166) to each consecutive group of five or six blades until all the blades are secured in groups.

NOTE: The blade retainers prevent the blades slipping out of the disk when the disk is raised.
 - (b) Evenly space the three pullers around the disk at the cut-away positions in the disk, then insert the three claws of each puller into the cut-away in the disk between the disk and the spacer.
 - (c) In equal progressive increments, screw the nuts of the pullers onto the studs drawing the centre claws upwards until the disk is separated from the spacer ring.
 - (d) Release the nuts of the pullers, then withdraw the pullers from the disk/spacer ring.
- (4) Assemble the multiple leg sling (Tool 404) to the stage 6 disk (Ref.Fig.128).
 - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
 - (b) Ensure that the three lifting clip chains are positioned in the outermost slot of each plate. Loosen the wingnut on each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.
 - (c) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep and lifting clips are abutting the blades, secure each clip with its wingnut.
- (5) Steadily raise the hoist until the disk is clear of the LP drive shaft, ensuring that it does not swing causing damage to the blades. Position and lower the disk onto a suitable pallet, then release the sling from the blades and disconnect the hoist from the sling. Assemble the protector/retaining band (Tool 1130) around the tips of the blades.

- (6) Release and remove from the outside of the case, the two bolts and spacers securing each of the three bolted and one probe bolted stator vanes to the case. Discard the bolts.
- (7) Identify the bolted stator vane aligned with the loading (cut-away) slot in the case, then pivot the inner end of the vane upwards and withdraw the outer end of the vane from the case loading slot. Ensure that the platforms (Tool 1390) are assembled to the containers (Tool 1373), then insert the vane into a platform.
- (8) Ease the remainder of the vanes, in turn, along the groove in the case and remove in the same manner as the bolted vane. To assist the movement of the vanes, apply lubricant A to the groove in the case. As the vanes are removed, ensure that they are placed in the platforms of the containers.
- (9) On engines to SB.72-8806-313 standard, remove the front and rear liners from the stage 6 vane groove.

K. Remove the Stage 6 - 7 Spacer Ring (Ref.Fig.140).

- (1) Check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8446-172).
- (2) Gain access from underneath the stand and through holes in the rear adapter, and remove the (larger) inner ring of nuts securing the spacer ring and disk to the HP drive shaft using the cranked ring wrench (Tool 1517), discard the nuts. Screw the driver (Tool 762) onto a bolt, then drift the bolt out of the three items. Unscrew the driver from the bolt, then drift the remaining bolts out. Collect all the bolts from the top of the disk, then place the bolts in a suitable container. Bolts to Pre SB.72-99 standard can be retained for further use but SB.72-99 standard and SB.72-8766-291 standard bolts are lifed at one build only and must be discarded at each dis-assembly.

DISASSEMBLY

- (3) Gaining access in the same manner, remove the nuts securing the spacer to the disk using the cranked ring wrench (Tool 1544) and socket wrench (Tool 1619).
- (4) Assemble the puller (Tool 470) to the spacer.
 - (a) Locate in the outer ring of spacer bolt-holes, a hole in line with the centre of a scallop in the inner edge of the spacer. Screw an assembly pin (Tool 1065 or 1067) on to the protruding bolt. Pull up on the assembly pin until the bolt shank is visible then turn the pin clockwise to align the flat on the bolthead with the spacer. Assemble a retaining clip (Tool 1038) to the bolt to secure it in the raised position then remove the assembly pin, the clip should abut the spacer and radiate outward. Draw up and retain a further five bolts, leaving five bolt-holes between each.

- (b) Attach a hoist to the multiple leg sling (Tool 1645), then position the hoist over the puller and secure the sling to the puller eye-bolts with the sling shackles.
 - (c) Position and lower the puller into the case, align the puller (tommy bared) slave nuts with the (clipped) bolts, and lower the puller onto the bolts until the slave nuts can be screwed onto the bolts. Lower the puller, screwing the slave nuts onto the bolts, until the puller is nearly touching the retaining clips, then pull the clips off the bolts, lower the puller to abut the spacer and fully tighten the slave bolts.
- (5) Screw in on the jacking screws until they abut the disk, then separate the spacer from the disk by screwing in the jacking screws in equal progressive increments. When released, raise the hoist until the spacer is clear of the LP drive shaft, remove the bolts from the outer flange of the spacer (from underneath), then position and lower the spacer onto a suitable clean flat surface.
- (6) Unscrew the puller slave nuts, then raise the hoist and position and lower the puller onto a suitable surface. Release and remove the sling from the puller and the hoist. Remove the bolts from the spacer and place in a suitable container with the bolts from the disk. Place the spacer in its correct slot in the container (Tool 1441).
- L. Remove the Stage 7 Compressor Disk from the HP Compressor Drive Shaft.
- (1) Ensure that a platform (Tool 1390) is assembled to the container (Tool 1373), then withdraw the rotor blades from the disk and insert them in the container platform.

- (2) Assemble the mechanical driver (Tool 476), claw assembly (Tool 477), bushed pin (Tool 479) and pin (Tool 478) to the disk (Ref.Fig.141).
 - (a) Gain access from underneath the stand and through holes in the rear adapter and insert a claw assembly in between the flange on the drive shaft and the disk, and align the tapped holes in the claws with the bolt holes in the disk.
 - (b) Insert the bushed pin into a bolt hole in the top of the disk in line with the centre claw (of the three claws), then screw the pin into the claw and tighten the pin.
 - (c) Lower the centre hole of the driver over the bushed pin and rest the pillars of the driver on the disk. If the pillars do not contact the disk, unscrew the left-hand large nut of the bushed pin.
 - (d) Insert a pin into each of the two outer holes in the driver, and screw a pin into each of the claws. Fully tighten the pins and lock with the knurled locknuts.
 - (e) Evenly dispose two more mechanical drivers and assemble to the disk following the same procedure.
- (3) Screw in on the left-hand large nut on each puller until the bushes contact the bearings in the drivers, then screw in the large nuts in equal progressive increments until the disk is separated from the drive shaft.
- (4) Remove the mechanical drivers, claws and pins from the disk.
 - (a) Release the knurled locknuts, unscrew and remove the two outside pins from each driver, then withdraw the three drivers from the bushed pins.
 - (b) Unscrew and remove the bushed pins from the claw assemblies, and withdraw the claw assemblies from underneath the disk through the access holes in the rear adapter.
- (5) Assemble the multiple leg sling (Tool 1086) to the disk.
 - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.

DISASSEMBLY

- (b) Remove the thumbnuts from the three adapters, then insert the adapter studs through three evenly spaced outer ring bolt holes in the disk, and screw the thumbnuts onto the studs.
- (6) Steadily raise the hoist until the disk is clear of the LP drive shaft, then position and lower the disk over the container (Tool 1419). Remove the hand nut and clamp plate from the container, then lower and locate the disk on the container locating plate. Assemble the clamp plate and nut to the centre screw of the container and fully tighten the nut. Release and remove the sling from the disk and the hoist.
- M. Remove the HP Compressor Rear Case from the Stand.
- (1) Assemble the multiple leg sling (Tool 1960) to the rear case.
- (a) Attach a hoist to the lifting ring of the sling, then position the sling over the rear case.
- (b) Remove the thumbscrews from the attachment brackets, then evenly dispose the three brackets on the front (top) flange of the rear case and secure them with the thumbscrews.
- (2) Unscrew and remove the slave nuts and bolts securing the rear case to the rear bearing adapter, and release and withdraw the stand clamps.
- (3) Steadily raise the hoist until the case is clear of the LP drive shaft, then position and lower the case onto a suitable pallet.
- (4) Release and remove the sling from the case and the hoist.
- N. Remove the Air Transfer Tube from the HP Compressor Drive Shaft (Ref.Fig.142).
- (1) Release the two bolts, then withdraw the steady (Tool 287) from the LP drive shaft and air transfer tube.
- (2) Attach a hoist to the lifting shackle of the lifting/extracting fixture (Tool 409), then position and lower the fixture over the LP drive shaft. Unscrew and withdraw the thrust plate, then align the five attachment bars with the holes in the end of the air

transfer tube. Screw the bars into the anchor nuts in the tube, then screw in on the thrust plate and locate it over the end of the LP drive shaft.

- (3) Screw in on the thrust plate until the air transfer tube is released from the HP drive shaft, then raise the hoist until the tube is clear of the LP drive shaft. Position and lower the tube onto a suitable pallet, then unscrew the five attachment bars.
- (4) Raise the hoist until the fixture is clear of the air transfer tube, then position and lower the fixture onto a suitable surface. Release the hoist from the fixture.

P. Remove the LP Compressor Drive Shaft from the HP Compressor Drive Shaft.

- (1) Assemble the lifting fixture (Tool 1068) (Ref.Fig.143) to the front (top) end of the LP drive shaft.
 - (a) Unscrew the locknut and withdraw the keep plate from the four body pins and towards the lifting plate.
 - (b) Offer the fixture to the drive shaft and slide the four lobes of the body through the cut-aways in the shaft. Turn the body to locate the lobes behind the lands in the shaft. Push the keep plate towards the shaft locating the two lobes in two of the cut-aways in the shaft and over the four pins of the body. Screw on the locknut and tighten it against the keep plate.
- (2) Assemble the LP drive shaft to the mobile stand or transporter.
 - (a) Attach a hoist to the lifting plate of the fixture, then steadily raise the hoist until the LP drive shaft is clear of the HP drive shaft. Position and lower the shaft in an area free of obstruction.

- (b) Screw the lifting fixture (Tool 1055) onto the rear (bottom) end of the shaft. Attach a second hoist to the lifting fixture, then raise the hoist to bring the LP drive shaft to the horizontal position.

NOTE: If a second hoist is not available, screw the protector (Tool 408) onto the rear end of the shaft in lieu of the lifting fixture, and support and/or guide the shaft by hand into the stand or transporter.

- (c) Position the transporter (Tool 1092) or mobile stand (Tool 1332) (Ref.Fig.143) under the LP drive shaft. Lower and/or man handle the shaft onto the transporter locating the rear end of the shaft on the small clamp, or onto the mobile stand, having first opened the bushes, and locating the front end of the shaft at the locking end of the stand. Close the bushes and lock them with the knurled nuts.
- (d) Remove the lifting fixture from the front end of the shaft by releasing the locknut, withdrawing the keep plate, then turning the body until its lobes align with the cut-aways in the shaft, withdraw the body. Assemble the protector (Tool 999) to the splines and labyrinth at the front end of the shaft and secure the protector with its thumbnut.
- (e) Unscrew and remove lifting fixture (Tool 1055) from the rear end of the shaft (if assembled), and screw the protector (Tool 408) onto the shaft (unless already assembled).

NOTE: The LP drive shaft can now be transferred to its disassembly section (72-31-04 Disassembly).

Q. Remove the HP Compressor Drive Shaft from the Stand (Ref.Fig.144).

- (1) Attach a hoist to the ring of the beam type sling (Tool 1060) and if the sling is assembled to the stand (Tool 405), unscrew and remove the securing nuts and washers. Raise the hoist and position the sling over the HP drive shaft, then lower the hoist and guide the sling onto the shaft aligning the attachment holes. Offer eight evenly spaced slave

bolts (Tool 385) up through the shaft and sling and screw slave nuts (Tool 385) onto the bolts. Fully tighten the nuts.

- (2) Unscrew the spacer sleeve (Tool 391) from the bottom of the drive shaft, and when released, lower the sleeve into the container in the ground.
- (3) Raise the hoist until the HP drive shaft is clear of the stand, then position the shaft over the stand (Tool 405). Ensure that the stand arms extend upwards, then lower the sling onto the studs in each arm. Assemble and secure a washer and nut to each stud, then release the hoist (Ref.Fig.145).
- (4) Release the stand trunnion lock and rotate the stand arms until the sling is underneath, then apply the lock.
- (5) Remove the roller bearing inner race from the rear (top) end of the HP drive shaft using the mechanical puller (Tool 1234) (Ref.Fig.145).
 - (a) Ensure that the three thumbscrews in the ring are unscrewed allowing the claws to touch the ring, and the centre screw is undone.
 - (b) Lower the puller ring over the drive shaft and align the three claws with the three cut-aways in the drive shaft below the inner race. Screw in the three thumbnuts to engage and lock the claws behind the inner race, then screw in the handle until the pad abuts and locates in the end of the shaft.
 - (c) Screw in the handle and draw the inner race off the shaft until it is released. Unscrew the three thumbnuts, disengage the claws from behind the race, then remove the puller. Lift the inner race from the shaft and place the race in a suitable container.
- (6) Unscrew and remove the nuts and bolts securing the balancing washers to the flange below the bearing journal on the drive shaft. Place the items in a suitable container.
- (7) Screw the lifting fixture (Tool 1069) onto the rear (top) end of the drive shaft and attach a hoist to the lifting eye.

- (8) Unscrew and remove the slave nuts from underneath the beam type sling, then withdraw the slave bolts from the drive shaft.
- (9) Raise the hoist and position and lower the drive shaft over container (Tool 1453). Release and hinge open the clamp of the container, then support the bottom of the shaft and position it in the container. Unscrew and remove the lifting fixture from the shaft and the hoist, then screw the protector (Tool 1238) on the end of the shaft and lower the shaft into the container. Separate the two halves of the protector (Tool 1241), then position and secure the protector about the labyrinths on the shaft. Assemble the clamp over the shaft and secure it to the container with the retaining pin.
- (10) Attach a hoist to the beam type sling (Tool 1051), then position and lower the sling into the HP compressor stand. Secure the two whips of the sling to the two lifting plates of the adapter with shackles. Raise the hoist until the adapter is clear of the stand, then position and lower the adapter onto a suitable surface and turn it onto its side. Disconnect the sling from the adapter and the hoist, then turn the adapter and rest it on its large flange.
- (11) Withdraw the spacer sleeve (Tool 391) from the container in the ground, then remove the protector (Tool 403) from the sleeve.

NOTE: The disassembly of the HP Compressor Assembly is now completed, but the front/rear compressor cases and the stator vane inner fixing rings must now be transferred to their disassembly section (72-33-01 Disassembly), and the bladed compressor disks to their disassembly section (72-33-02 Disassembly).

HP COMPRESSOR CASE AND VANES - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-00 Disassembly for general information.
- B. Throughout the text, special tools are quoted by their reference number; e.g. Tool 1234. For a complete list of the tooling required for disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment, Table 1001.

2. Disassemble the Front and Rear Case

- A. Remove Items from the Rear Case (Ref.Fig.101).

- (1) Place the rear case with the rear (end) flange down, onto a flat protected surface, ensuring that the shouldered pin shrunk into the flange does not rest on the surface.
- (2) Unscrew and remove the two blank plugs from the probe mounting block on the outside of the case at the exit guide vane location, then unscrew the four bolts and remove the mounting block. Discard the bolts.

NOTE: It should be noted that removal of the probe mounting block may result in the shearing of the bolts in the compressor casing. If this occurs, refer to the Rolls-Royce, Olympus 593 Project Office, Filton, Bristol, for corrective action.

- (3) Remove from the outside of the case the eight pairs of bolts and sleeves securing the bolted exit guide vanes, ensuring that when the vane located in the loading slot inside the case is released, the vane is pivoted about its root and removed from the loading slot. Ensure that a platform (Tool 1390) is assembled to the container (Tool 1373), then place the vane in the platform. Discard the vane securing bolts.
- (4) Apply lubricant 'A' or release agent 'A' around the vane roots/case groove to assist the removal of the vanes.

- (5) In turn, ease the vanes around the groove inside the case and pivot the vanes out of the loading slot. Place the vanes in the container immediately they are removed from the case.
- (6) On engines to SB.72-8806-313 standard, remove the front and rear liners from the stage 7 vane groove.
- (7) Remove from the outside of the case at stage 6 stator vane position, the two pairs of blank plugs.

B. Remove Items from the Front Case (Ref.Fig.101 and 102).

- (1) If required, attach the multiple leg sling (Tool 1053) to the rear (larger) diameter flange of the rear case, and using a hoist, position and lower the case onto a flat protected surface, ensuring that the shouldered pin shrunk into the bottom flange does not rest on the surface. Release and remove the hoist and sling.
- (2) Remove from the outside of the case at stage 5 stator vane position, the four pairs of bolts and sleeves securing the bolted vanes, ensuring that when the vane located in the loading slot inside the case is released, the vane is pivoted about its root and removed from the loading slot. Ensure that a platform (Tool 1390) is assembled to the container (Tool 1373), then place the vane in the platform.
- (3) Apply lubricant 'A' or release agent 'A' around the vane roots/case groove to assist the removal of the vanes.
- (4) In turn, ease the vanes around the groove inside the case and pivot the vanes out of the loading slot. Place the vanes in the container immediately they are removed from the case.
- (5) Remove from the outside of the case at stage 5 stator vane position, the two pairs of blank plugs.

OVERHAUL

- (6) Release the two locknuts, then remove the two blank plugs from one of the probe mounting blocks on the outside of the case at stage 4 stator vane position. Unscrew the two retaining bolts and remove the mounting block. Release and remove the remaining probe mounting block, locknuts and blank plugs from the stage 4 stator vane position.

NOTE: It should be noted that removal of the probe mounting block may result in the shearing of the bolts in the compressor casing. If this occurs, refer to the Rolls-Royce, Olympus 593 Project Office, Filton, Bristol, for corrective action.

- (7) Release the two locknuts, then remove the two blank plugs from one of the two probe mounting blocks on the outside of the case at stage 3 stator vane position. Unscrew and remove the two retaining bolts and spacers, and remove the mounting block. Release and remove the remaining probe mounting block, locknuts, blank plugs and spacers from the stage 3 stator vane position.

NOTE: It should be noted that removal of the probe mounting block may result in the shearing of the bolts in the compressor casing. If this occurs, refer to the Rolls-Royce, Olympus 593 Project Office, Filton, Bristol, for corrective action.

- (8) Release and remove from the outside of the front case all pipe, support and mounting brackets that are still attached.

3. Disassemble the Inner Fixing Rings

A. Remove Items from Stage 1 Inner Fixing Ring (Ref.Fig.102).

- (1) Remove the inner fixing ring from its container (Tool 1441) and place the ring on a flat protected surface with the labyrinth extending upwards.

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8259-153).

(2) Remove the two nuts securing a retaining plate, then remove the plate and withdraw the bolts from the ring. Release and remove the two remaining retaining plates.

(3) Remove the retaining ring from the remaining bolt and withdraw the bolt.

NOTE: Do not separate the fixing ring from the labyrinth ring.

(4) On engines to SB.72-8694-297 standard, release peening and remove anti-fret liners from the fixing ring groove.

(5) Place the inner fixing ring in the appropriate part of container (Tool 1441).

B. Remove Items from Stage 2 Inner Fixing Ring (Ref.Fig.102).

(1) Remove the inner fixing ring from its container (Tool 1441) and place the ring on a flat protected surface with the labyrinth extending upwards.

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8259-153).

(2) Remove the two nuts securing a retaining plate, then remove the plate and withdraw the bolts from the ring. Release and remove the two remaining retaining plates.

(3) Remove the retaining ring from the remaining bolt and withdraw the bolt.

NOTE: Do not separate the fixing ring from the labyrinth ring.

(4) On engines to SB.72-8694-297 standard, release peening and remove anti-fret liners from the fixing ring groove.

(5) Place the inner fixing ring in the appropriate part of container (Tool 1441).

HP COMPRESSOR ROTOR - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-00 Disassembly for general information.
- B. The HP compressor rotor will, in the main, have been disassembled during the HP compressor assembly disassembly, with the exception of the disks (stages 1 to 6), which will have their blades assembled.
- C. The bladed disks will be received on pallets with protector/retaining bands assembled to the tips of the blades, and the disassembly only entails the removal of the blades from the disks. The blades of stages 3 to 6 are loose in the disks and are only retained by retaining bands, but the blades of stages 1 and 2 are secured by retaining plates.

2. Disassemble the HP Compressor Bladed Rotor Disks (Ref.Fig.101)

A. Remove the Blades from Stage 1 Disk.

(1) Assemble the bladed disk to support (Tool 1676).

(a) Assemble the multiple leg sling (Tool 404) to the stage 1 disk.

(i) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.

(ii) Ensure that the three lifting clip chains are positioned in No.1 slot of each plate. Loosen the wingnut of each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.

(iii) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep plate and lifting clips are abutting the blades, secure each clip with its wingnut.

NOTE: The bladed disk may be lifted by hand if preferred, but care must be taken against injury to the operator and/or damage to the blades.

- (2) Remove the blade protector/retaining band from the tips of the blades, then remove the retaining bands (Tool 1166) in turn and ease the blades out of the disk. Ensure that a platform (Tool 1390) is assembled to a container (Tool 1374), and stow the blades in the platform as they are removed from the disk.
- (3) Remove the disk from the support and stow and secure in the container (Tool 1419) (Ref.para.C.(4)).

E. Remove the Blades from Stage 5 Disk.

- (1) Assemble the bladed disk to the support (Tool 1676) as detailed in para.A.(1), either manually or using the multiple leg sling (Tool 404), ensuring that the clip chains are positioned in No.5 slot.
- (2) Remove the blade protector/retaining band from the tips of the blades, then remove the retaining bands (Tool 1166) in turn and ease the blades out of the disk. Ensure that a platform (Tool 1390) is assembled to a container (Tool 1373), and stow the blades in the platform as they are removed from the disk.
- (3) Remove the disk from the support and stow and secure in the container (Tool 1419) (Ref.para.C.(4)).

F. Remove the Blades from Stage 6 Disk.

- (1) Assemble the bladed disk to the support (Tool 1676) as detailed in para.A.(1), either manually or using the multiple leg sling (Tool 404), ensuring that the clip chains are positioned in No.6 slot.
- (2) Remove the blade protector/retaining band from the tips of the blades, then remove the retaining bands (Tool 1166) in turn and ease the blades out of the disk. Ensure that a platform (Tool 1390) is assembled to a container (Tool 1373), and stow the blades in the platform as they are removed from the disk.
- (3) Remove the disk from the support and stow and secure in the container (Tool 1419) (Ref.para.C.(4)).

GENERAL OVERHAUL
MK.610-14-28

HP TURBINE ROTOR - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-01 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The HP turbine rotor sub-assembly is conveyed to the disassembly area on a transport pallet. This incorporates support blocks upon which the turbine assembly rests, thus facilitating the installation of turbine lifting equipment. Turbine blades are interlocked and cannot be removed separately. The complete blade assembly is evenly removed in progressive stages from the turbine disk.

2. Prepare to Remove Turbine Blades

NOTE: If a dynamic balance check of the HP turbine rotor is required transfer the turbine rotor to the HP compressor sub-assembly area (Ref.72-51-03, Assembly).

A. Install Turbine Rotor in Mobile Stand (Ref.Fig.101).

- (1) Secure lifting fixture (Tool 1113) to the end of mandrel (Tool 139). Ensure that the securing bolt is tightened.
- (2) Prepare mobile stand (Tool 1111) to accept the mandrel.
 - (a) Check that the clamp support tubes are securely held in the vertical position by the pins located on the angled support tubes.
 - (b) Open the clamps in readiness for the mandrel and lower the mandrel on to the clamps.
- (3) Assemble mandrel extension (Tool 1135) to the end of the mandrel and secure it with four nuts and washers.

OVERHAUL

- (4) Close the clamp positioned near the mandrel extension. Swivel the mandrel to the vertical position so that serrations in the disk are uppermost. Remove the nuts from the disk studs.

NOTE: Each clamp is secured vertically or horizontally by a plunger type pin which must be released or engaged by hand.

- (5) Assemble lifting fixture (Tool 1120) to the HP turbine rotor disk.
 - (a) Ensure that the rotor is securely positioned on the pallet (Tool 1082).
 - (b) Carefully lower the lifting fixture into the centre bore of the disk. Engage the support feet by turning the knurled nuts to the locked position.
- (6) Attach a crane hoist to the lifting fixture and carefully position and lower the turbine rotor over the vertical mandrel and locate over the studs. Secure the turbine rotor with the disk nuts removed earlier. Release and remove the lifting fixture from the turbine rotor.

B. Install Turbine Rotor in Blading Fixture (Ref.Fig.102).

- (1) Place the blade platform stand (Tool 954) on the top of the blading fixture (Tool 1122).
- (2) Attach a crane hoist to the lifting fixture on the end of the mandrel, then position and lower the turbine/mandrel into the blading fixture and by adjusting the hand wheel of the fixture, ensure that the underside of the blades are slightly above the blade platform stand.

3. Turbine Blades Slackness Check

A. Checking Procedure (Ref.Fig.102).

- (1) Carefully check each blade for movement. This check is done by hand.

OVERHAUL

(2) If movement is evident and a clearance occurs at the centre section of the shroud interlocking joints, measure the gaps as follows.

- (a) Evenly and progressively shim the gaps around the total circumference of the interlocking shroud assembly. Initially use one shim only of no more than 0.0015 in. (0,0381 mm) thickness at each gap position. If the gap is less than the shim thickness, shim alternate gaps. Progressively increase the shim thickness at each gap until the maximum thickness is achieved.
- (b) Record the mean thickness of final shimming, this must be no greater than 0.001 in. (0,0254 mm). If the mean gap exceeds the given limit the blades are unacceptable for further engine running and must be rejected.

4. Remove Turbine Blades from Turbine Disk

A. Remove Locking Plates from Turbine Blades (Ref.Fig.102).

- (1) Use locking tools (Tool 1080 and 1081), release the locking plates.
 - (a) Bend the legs of each locking plate away from the turbine disk locking pillars until the plates are released.
 - (b) Remove and discard the locking plates.

B. Remove Turbine Blades.

NOTE: Owing to the interlocking turbine blade shrouds, the blades cannot be removed from the turbine disk singly in one operation.

- (1) Use driver (Tool 907) and a light-weight hammer, carefully tap each blade in turn at the solid section of the blade root to effect a gradual and even removal of the blades from the turbine disk. Adjust the hand wheel on the blading fixture to maintain a clearance between the fixture and the blades.
- (2) Place the blades in containers (Tool 1425) as they are released from the disk. Identify rejected blades clearly with the reason for rejection.

OVERHAUL

C. Remove Turbine Disk from Blading Fixture.

- (1) Attach a crane hoist to the lifting fixture on the end of the mandrel and carefully lift the assembly out of the blading fixture.
- (2) Position and secure the mandrel vertically in the mobile stand. Ensure that the clamp is securely attached to the mandrel.
- (3) Lower the mandrel horizontally in the mobile stand, then remove the crane hoist.

D. Transfer Turbine Disk to Cleaning Mandrel and Stand (Ref.Fig.103).

- (1) Attach lifting fixture (Tool 1141) to the turbine disk and ensure that the fixture is securely tightened.
- (2) Separate the turbine disk from the mobile stand mandrel.

CAUTION: TURBINE DISK MUST BE SUPPORTED BY LIFTING FIXTURE AND CRANE HOIST BEFORE MANDREL/TURBINE DISK SECURING NUTS ARE SLACKENED.

- (a) Slacken the nuts securing the mandrel to the turbine disk.
- (b) Carefully raise the assembly from the mobile stand to allow sufficient clearance for the removal of the mandrel.
- (c) Remove the mandrel from the turbine disk and secure it in the mobile stand.
- (3) Hold the cleaning mandrel (Tool 1437) in the centre bore of the turbine disk and lower the assembly on to stand (Tool 1439).
- (4) Remove the lifting fixture and crane hoist from the turbine disk.
- (5) Remove the blade platform stand from the blading fixture.
- (6) Remove the lifting fixture and mandrel extension from the mobile stand mandrel.

5. Remove Turbine Hub from No.23 Labyrinth Seal and Disassemble Components

NOTE: On receipt from engine disassembly, protector (Tool 1061) should be assembled to the rear (No.24) labyrinth, and protectors (Tools 1062 and 1063) assembled to the hub and front (No.23) labyrinth. If protectors are removed during disassembly, or are not assembled, ensure that they are assembled on completion of the disassembly.

A. Remove Hub from Labyrinth (Ref.Fig.104).

- (1) Release the retaining rings securing the main bolts to the hub. Withdraw the bolts from the hub and place in a suitable container.
- (2) Remove the nuts, bolts and washers securing the hub to the labyrinth. Separate the components and place the hub in a suitable container.

B. Disassemble Damping Ring from No.23 Labyrinth Seal and Remove Bolts from No.24 and 26 Labyrinth Seal (Ref.Fig.104).

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8444-225).

- (1) Remove the nuts and bolts securing the damping ring to the labyrinth seal.
- (2) Place the labyrinth seal on a suitable flat surface. Ensure that no damage to the labyrinth or damping ring is incurred during removal of the ring.

NOTE: The damping ring slightly overlaps the holes in the labyrinth. This provides suitable points of contact to assist removal.

- (a) Use an implement of soft material to commence removal of the damping ring. Careful leverage will also assist removal.

PRINTED IN ENGLAND

TN32746

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Identify the labyrinth seal and damping ring as balanced matching components that are not interchangeable with other similar items.
- (c) Place the components in suitable containers.

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8444-225).

- (3) Remove the nuts, bolts and washers from the balance hole positions in No.24 and 26 labyrinth seal, then place the labyrinth seal in a suitable container.
- (4) Ensure that the module identification plate is retained with the disassembled components.

LP TURBINE NOZZLE - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-01, Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The low pressure (LP) turbine nozzle vane assembly is transported complete on a mobile table to the disassembly area. The sub-assembly is supported by a lifting fixture which incorporates retaining hooks to hold each nozzle vane separately in position.

2. Disassemble Turbine Nozzle Vane Assembly

- A. Remove Each Nozzle Vane from Diaphragm (Ref.Fig.101).
 - (1) Support each nozzle vane during the releasing procedure. Unscrew the knurled nut on the lifting fixture retaining hook and depress the hook to disengage it from the nozzle vane.
 - (2) Turn the retaining hook through an angle of approximately 90 deg to allow withdrawal from the nozzle vane.
 - (3) Withdraw the retaining hook from the nozzle vane and carefully manipulate the nozzle vane away from the diaphragm.
 - (4) Place each vane in container (Tool 1371). Remove the nozzle vane assembly lifting equipment.
- B. Remove Cover Unit from Nozzle Vane Support Diaphragm (Ref.Fig.101).
 - (1) Remove the cover unit/diaphragm from the mobile table and place on a suitable flat surface.
 - (2) Remove the cover unit retaining nuts. Engage the mechanical puller (Tool 962) with the cover and diaphragm. Carefully lever the cover in equal stages until it becomes detached from the diaphragm.
 - (3) Remove the labyrinth retaining bolts and plates. Place the diaphragm in container (Tool 1417) and ensure that it is firmly clamped in position.

LP TURBINE ROTOR - DISASSEMBLY

1. General

- A. Prior to commencing disassembly refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The LP turbine sub-assembly will be conveyed to the disassembly area on a transport pallet. The sub-assembly is secured to a disassembly stand which can be rotated to facilitate access for removal of components. Pallets are used for the temporary storage and transportation of components.

2. Disassemble the LP Turbine Rotor

- A. Position Assembly on Turbine Support Tool.

NOTE: During the following operations retain the protectors (Tool 1134 and 1138) on the labyrinth seals where practical, replace at the earliest opportunity when they have been removed.

- (1) Screw the lifting fixture (Tool 1142) onto the LP turbine disk hub (Ref.Fig.101). Attach an overhead crane to the eye of the hub lifting fixture, then raise the LP disk assembly.
- (2) Position the assembly over the turbine support (Tool 1670) mounted on a solid work bench, centralize the disk over the ring, then lower on to the ring. Remove the crane and lifting fixture.

- B. Turbine Blades Slackness Checks (Ref.Fig.101).

- (1) Carefully check each blade for movement. This check is done by hand.

OVERHAUL

- (2) If movement is evident and clearance occurs at the centre section of the shroud interlocking joints measure each gap in turn. If any gap exceeds 0.001 in. (0,0254 mm) the blades are unacceptable for further engine running and must be rejected.

C. Remove Turbine Blades from Disk.

- (1) Straighten the turbine blade locking tabs.

NOTE: Owing to the interlocking turbine blade shrouds, the blades cannot be removed from the turbine disk singly in one operation.

- (2) Using the driver (Tool 907) and a light-weight hammer, carefully tap each blade in turn at the solid section of the blade root to effect a gradual and even removal of the blades from the turbine disk, ensuring that no blade is knocked down more than 0.125 in. (3,175 mm) otherwise the blades may lock together.

- (3) As the blades are released store them in the container (Tool 1426). Identify rejected blades clearly with the reason for rejection.

D. Prepare Assembly for Removal of Hub and Labyrinth.

NOTE: In order to remove the items from the disk, the hub must be assembled to the stand, the stand turned 90 deg and the hub repositioned on the stand.

- (1) Assemble the disk/hub assembly to the stand (Tool 873).
 - (a) Release the thumbnuts of the clamp and hinge open the clamp.
 - (b) Position the fixture (Tool 1140) in the clamp ensuring that the locating pin engages in the clamp, then close and secure the clamp with its thumbnuts.

- (c) Remove the retaining nut, washer and clamp plate from the longer arm of the fixture, then using the hand turning gear, position the arm vertical with the longer arm uppermost (Ref.Fig.101).
 - (d) Screw the lifting fixture (Tool 1142) onto the LP disk hub, then attach an overhead crane to the fixture eye.
 - (e) Raise the disk and position and lower onto the stand fixture. Remove the crane and lifting fixture (Tool 1142), then secure the disk to the adapter using the plate, washer and nut.
 - (f) Using the hand turning gear, turn the clamp so that the axis of the disk is horizontal.
- (2) Reposition the disk/hub assembly on the stand.
- (a) Attach an overhead crane to the eye of the lifting fixture (Tool 1141), then ensure that the adjustable pad is unscrewed.
 - (b) Position and lower the lifting fixture over the disk, then screw in on the adjustable pad until the disk is clamped between the fixture pads.
 - (c) Take the weight of the disk with the crane, then remove the clamp plate, washer and nut from each end of the fixture.
 - (d) Carefully remove the LP disk from the long arm of the fixture and transfer the disk to the short arm ensuring that the hub engages first. Secure the disk to the fixture with the splined plate, washer and nut.
 - (e) Remove the crane and lifting fixture (Tool 1141).
 - (f) Turn the clamp so that the axis of the disk is vertical.

E. Remove the Labyrinth Ring and Housing from the Disk.

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8444-225).

- (1) Using the wrench (Tool 1492), remove the nuts and bolts securing the hub, disk and labyrinths together.
- (2) Carefully remove the nut, washer and splined plate securing the LP disk assembly to the fixture.

CAUTION: THE DISK, HUB AND LABYRINTHS ARE NOW LOOSE AND INSECURE; ENSURE THAT THE DISK IS NOT KNOCKED CAUSING IT TO TILT AND FALL.

- (3) Assemble the puller (Tool 1015) to the labyrinth housing (Ref.Fig.102).
 - (a) Unscrew the locking screws and withdraw the locating pins, then finger-tighten the lock screws.
 - (b) Position the puller on the labyrinth housing, locating the puller housing in the cooling air flanged duct.
 - (c) Using the tommy bar, turning it clockwise to lift, and anti-clockwise to lower, adjust the puller body height until the locating pins align with the extractor holes in the labyrinth housing.
 - (d) Release the locking screws, locate and fully enter the locating pins into the labyrinth housing, then secure the locating pins with the locking screws.
 - (e) Turn the tommy bar clockwise, moving the body from the housing and withdrawing the labyrinth housing from the flanged duct.
 - (f) Remove the puller and labyrinth housing assembly.
 - (g) Release and withdraw the puller pins, then remove the puller from the housing.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Secure the disk and hub to the fixture using the splined plate, washer and nut, then secure the hub to the disk using two bolts, washers and nuts in diametrically opposite holes.

F. Remove Hub and Labyrinth Assembly from Disk.

- (1) Turn the clamp so that the axis of the disk is horizontal.
- (2) Assemble the lifting fixture (Tool 1141) to the disk, then attach an overhead crane to the fixture and take the weight of the disk.
- (3) Remove the splined plate, washer and nut, then carefully remove the disk from the short arm of the fixture and assemble it to the longer arm ensuring that the disk engages first. Secure the hub to the fixture with the clamp plate, washer and nut.
- (4) Turn the clamp so that the axis of the disk is vertical, then remove the clamp plate, washer and nut and screw the lifting fixture (Tool 1142) onto the hub. Attach a crane to the lifting fixture.
- (5) Raise the disk from the fixture, then position and lower it onto a pallet. Disconnect the crane and remove the lifting fixture from the hub.
- (6) Assemble the plates, washers and nuts to the stand fixture.

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8444-225).

- (7) Remove the nuts and bolts securing the hub to the disk, then remove the hub.

OVERHAUL

G. Remove the Air Duct and Bearing from the Hub.

- (1) Remove the nuts, washers and bolts securing the cooling air flanged duct to the hub, then remove the duct from the hub.
- (2) Remove the bearing inner race from the hub using the mechanical puller (Tool 1137) (Ref.Fig.103).
 - (a) Ensure that the body of the puller is withdrawn from its thrust plate and that the thumbscrew of each claw is unscrewed.
 - (b) Place the puller on the end of the hub and engage the thrust plate in the end of the hub.
 - (c) Operate the puller and engage the three claws in the cutaways in the hub and under the inner race. Tighten the thumbscrew of each claw to lock the claws under the race.
 - (d) Operate the puller and withdraw the inner race from the hub. Release the claws and remove the inner race from the puller.

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8444-225).

- (3) Remove the nuts, washers and bolts securing the labyrinth ring to the housing, then remove the ring.
- (4) Place all components in containers and store all the special equipment.

LP TURBINE BEARING SUPPORT - DISASSEMBLY

1. General

- A. Prior to commencing disassembly refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for disassembly and for the Manufacturers Part No. refer to Special Tools, Fixtures and Equipment Table 1001.

2. Disassemble the LP Turbine Bearing Support

A. Disassemble the Rear Cover Assembly (Ref.Fig.101).

- (1) Locate the bearing housing on the four pillars of the support plate (Tool 1256) (Ref.Fig.102).

NOTE: Para.(2) and (3) do not apply if the rear cover is to be disassembled while still attached to the bearing housing.

- (2) Release the rear cover assembly from the bearing housing (if still attached) by using wrench (Tool 1584) to remove the 27 securing nuts. Withdraw the cover from the housing disengaging the oil tube and the retaining pin. If the flanges of the cover and housing are difficult to separate, remove the blankets (Ref.para.(5)), then use a hammer and alloy drift and lightly drift on the smaller flange of the cover. Withdraw the retaining ring and bearing outer race/rollers from the bearing housing, and place the bearing in a container.
- (3) Bolt the holding fixture (Tool 847) to the Hydraclamp with the clamps uppermost (Ref.Fig.101), then with the clamps withdrawn, position the rear cover on the fixture, engage the clamps over the rear cover flange and tighten the retaining nuts.

OVERHAUL

- (4) Disassemble the actuating arm and bracket from the rear cover.
- (a) If the (end) insulation blanket is still assembled, release the four nuts and bolts (pre SB.72-20), or cut the locking wire (SB.72-20), and remove the blanket.
 - (b) Remove the 12 bolts securing the (end) cover to the rear cover, then withdraw the (end) cover disengaging it from the locating pin and the oil tube.
 - (c) Remove the insulation blanket covering the actuating arm shaft by cutting the locking wire (SB.72-20 or pre SB.72-121 standard only).
 - (d) Remove the split pin (SB.76-2 standard only), then remove the nut from the actuating arm or bolt and withdraw the retainer and seal from the cover.
 - (e) Support the actuating arm inside the rear cover, then withdraw the actuating arm shaft and seal from the rear cover and remove the actuating arm when released. If SB.76-2 Part 2 only is embodied, remove the bolt and sleeve from the shaft.
 - (f) Remove the nut, special bolt and adjusting washer from the bracket, then release and remove the bracket from the bracket on the bottom of the sump.
- (5) Release the wire-locking from the eyelets securing the two (side) insulating blankets together. If the rear cover is still assembled to the bearing housing, remove the four nuts securing the insulating blankets using wrench (Tool 1584). Withdraw the two insulating blankets from the rear cover.

DISASSEMBLY

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) If the rear cover is still assembled to the bearing housing, remove the cover as detailed in para.(2) and place it on a bench with the front (larger) flange uppermost. If the cover is assembled to the holding fixture, release and withdraw the fixture clamps, then remove the cover and place it on a bench with the front flange uppermost.
- (7) Remove the two nuts and bolts securing the oil tube to the inside of the rear cover and withdraw the tube. Protect and blank each end of the tube.
- (8) Remove the three nuts and bolts securing the transfer block and oil tube to the (end) cover and separate the items. The two peened bolts assembled in the end cover on SB 72-180 standard engines are to prevent incorrect assembly of the transfer block and must not be removed.

B. Remove the Sockets and Seal Housings from the Cover and Sleeve Assemblies (Ref.Fig.102).

- (1) Remove the air feed socket from the cover and sleeve assemblies using the mechanical puller (Tool 455) and adapter (Tool 449) (Ref.Fig.103).
 - (a) Screw the adapter onto the puller until the puller pin engages in the slot of the adapter.
 - (b) With the adapter/puller at an angle to the axis of the air feed socket, lower the puller plate into the socket until the plate is beneath the socket. Align the adapter/puller with the axis of the socket engaging the step of the plate in the end of the socket. Ensuring that the plate remains correctly engaged in the socket, screw down on the adapter until its body contacts the cover with the larger cut-outs aligned with the bolt flange.
 - (c) Screw the adapter onto the puller until the socket is released from the cover and sleeve. Unscrew the adapter until the socket is out of the adapter body, then remove the socket from the puller.

- (2) Remove the two vent sockets from the cover assembly using the mechanical puller (Tool 448) and adapter (Tool 449) (Ref.Fig.103).
 - (a) Screw the adapter onto the puller until the puller pin engages in the slot of the adapter.
 - (b) With the adapter/puller at an angle to the axis of one of the vent sockets, lower the puller plate into the socket until the plate is beneath the socket. Align the adapter/puller with the axis of the socket engaging the step of the plate in the end of the socket. Ensuring that the plate remains correctly engaged in the socket, screw down on the adapter until its body contacts the cover with the larger cut-outs aligned with the bolt flange.
 - (c) Screw the adapter onto the puller until the socket is released from the cover. Unscrew the adapter until the socket is out of the adapter body, then remove the socket from the puller.
 - (d) Remove the remaining socket from the cover repeating the procedure (Ref.para.(a) to (c)).
- (3) Remove the two seal housings from the cover and sleeve assemblies using the mechanical puller (Tool 447) and adapter (Tool 449).
 - (a) Unscrew and remove the remaining bolt (if assembled) securing each seal housing to the cover assembly.
 - (b) Screw the adapter onto the puller until the puller pin engages in the slot of the adapter, then pull out the locking bar until the claws close inwards.
 - (c) Lower the adapter/puller onto one of the housings and slide the puller claws into the housing until the puller abuts the outer end of the housing. Press the locking bar down to lock the claws behind the inner end of the housing.

- (d) With the cut-outs of the adapter body aligned with the three bolt flanges, screw the adapter onto the puller until it contacts the cover, then continue screwing until the housing is released.
 - (e) Pull out on the locking bar to close the claws, and withdraw the housing from the puller.
 - (f) Remove the remaining seal housing from the cover/sleeve repeating the procedure (Ref.(b) to (e)).
- C. Remove the Cover and Sleeve Assemblies from the Bearing Housing.
- (1) Remove the cover assembly using the mechanical puller (Tool 1250) (Ref.Fig.104).
 - (a) Ensure that the knurled nuts are loose, and that the tommy bars of the six claws point to the OPEN position. Ensure that the location plate has been retracted.
 - (b) Lower the puller over the cover and rest the claws on the bearing housing. Screw in the smaller central tommy bar and engage the location plate in the bearing housing. Unscrew the larger central tommy bar until the claws are clear of the bearing housing, then turn the tommy bar of each claw to the CLOSED position to engage the claws with the cover, and lock in position with the thumbnuts.
 - (c) Unscrew the large tommy bar until the cover is released from the housing.
 - (d) Release the knurled nuts of the claws, then turn the claw tommy bars to the OPEN position. Lift the mechanical puller off the bearing housing, then remove the cover from the housing.

(2) Remove the sleeve assembly using the mechanical puller (Tool 1251).

(a) Remove the sleeve assembly repeating the procedure (Ref.(1), (a) to (d)) using the puller (Tool 1251).

NOTE: The alternative puller (Tool 1964) is assembled to the bolts at the top of the bearing housing and pulls on a ring engaged with the six dogs on the sleeve by turning the six tommy nuts.

D. Remove the Outer Labyrinth Housing Assembly from the Bearing Housing (Ref.Fig.105).

(1) Remove the 27 D-headed bolts (Ref.Fig.102) from the bearing housing flange, by turning each bolt in turn 180 deg until the flat on the bolt aligns with the step of the housing and withdrawing the bolt.

(2) Unscrew and remove the eight nuts and bolts that secure the outer labyrinth housing to the bearing housing (Ref.Fig.102).

(3) Invert the bearing/labyrinth housings on the support plate so that the outer labyrinth housing is uppermost.

(4) Remove the outer labyrinth housing using the mechanical puller (Tool 1252).

(a) Ensure that the knurled nuts are loose and the tommy bars of the claws lie circumferentially. Ensure that the claw plate is retracted.

(b) Lower the puller over the outer labyrinth housing and rest the three thrust plate pillars on the bearing housing. Align the claws with air holes in the outer labyrinth housing, then unscrew the large tommy bar to lower the claws into the holes until the claw tommy bars can be turned 90 deg. Turn the claw tommy bars 90 deg to locate the claws under the outer labyrinth, then lock each claw by tightening the knurled nuts.

OVERHAUL

- (c) Screw down on the large tommy bar and withdraw the outer labyrinth from the bearing housing. When the outer labyrinth is released, unscrew the knurled nuts of the claws and turn the claw tommy bars 90 deg. Withdraw the mechanical puller from the outer labyrinth, then remove the labyrinth from the bearing housing.
- (5) Remove the bearing housing from the support plate.

NOTE: The disassembly of the LP turbine bearing support is now complete. Place all items in suitable containers and despatch to the cleaning department.

E. Disassemble the LP Turbine Rotor Bearing.

CAUTION: COMPONENTS MUST BE LABELLED AND KEPT TOGETHER AS A SET.

- (1) Clean the bearing prior to disassembly (Ref.72-09-00 Cleaning Process D).
- (2) Disassemble the rollers and cage from the outer track.

NOTE: The following procedure should be carried out in an approved 'clean' room.

- (a) Hinge open the lever of the pliers (Tool 1983) and locate the plier jaws over a roller.
- (b) Turn the tommy bar to apply sufficient force to the plier jaws to grip the roller, then close the lever and extract the roller from the cage. Release the pliers from the roller.
- (c) Repeat the procedure until all the rollers are removed, then withdraw the cage.
- (d) Place the rollers, outer track and cage in protective bags.

OVERHAUL

TURBINE EXHAUST DIFFUSER - DISASSEMBLY

1. General

- A. Prior to commencing disassembly refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For the complete list of tooling required for disassembly and for the Manufacturers Part No. refer to Special Tools, Fixtures and Equipment Table 1001.
- C. Throughout this text all instructions will be given in relationship to the vanes, of which there are 10, five having air or oil tubes passing through them. The vanes are numbered 1 to 10 in a clockwise direction as viewed from the rear, with No.1 being the first vane from the (normal) vertical top position, identified by a dowel hole in the outer case front flange.
- D. This chapter deals with the disassembly of the turbine exhaust diffuser assembly, but all the items removed do not belong to 72-53-00, and these items must be identified and segregated under their own breakdowns as listed hereafter. In addition the LP turbine bearing support must be removed and dispatched to 72-52-03 for disassembly.

72-52-03	LP Turbine Bearing Support
71-32-02	Engine Heatshields
71-73-06	Fuel Drain Assembly
72-54-01	Spherical Joint Flange
75-03-02	Flanged Connection
76-13-03	PNC Signal Pitot
76-21-02	LP Signal Shaft System
77-12-03	Engine Power Pitot

- E. To assist in freeing seized nuts and bolts, in particular those securing the flanges of the outer case/spherical joint flange, apply release agent 'A' and allow it to soak in.

2. Disassembly the Turbine Exhaust Diffuser

- A. Assemble the Turbine Exhaust Diffuser to the Stand (Ref. Fig.101).
- (1) Ensure that the mounting plate (Tool 309) is bolted to the stand (Tool 832) and that the stand arms are extending downwards.

OVERHAUL

NOTE: On engines to pre SB.72-8038-181 lifting fixture (Tool 305 or 1953) may be used.

- (2) Release the clamps and remove the protector (Tool 437) from the rear of the diffuser. On engines to pre SB.8038-181 standard, lower the lifting fixture (Tool 305) onto the rear centre cone of the diffuser, align the captive bolts of the fixture with the anchor nuts of the cone, then screw the bolts into the anchor nuts. On engines to pre or SB.72-8038-181 standard, ensure that the thumbnuts are unscrewed and the latches are in the 'FREE' position, then lower the lifting fixture (Tool 1953) onto the rear centre cone. Turn the latches to the 'LOCKED' position and tighten the thumbnuts.
- (3) Attach a hoist to the lifting ring of the fixture, then position the diffuser over the stand mounting plate. Ensure that the four mounting plate clamps are positioned out of the way, then aligning the dowel hole in the front flange of the outer case as near the mid position as possible with one of the cutaways in the mounting plate, lower the diffuser onto the plate aligning the bolt holes. Secure the outer case with the mounting plate clamps. Release and remove the lifting fixture, then remove the hoist from the fixture.

B. Remove and Disassemble the Drain Valve (Ref.Fig.102 or 102A).

NOTE: There are two alternative procedures for disassembling the drain valve from the outer case. The procedure is dependant on whether an internal boss or a saddle plate assembly is used at the drains block mounting location on the outer case.

- (1) Remove the drain valve from the bottom of the outer case (Engines with internal boss) (Ref. Fig.102).
 - (a) Remove the nuts from the three eccentric headed bolts and remove the sealing plate, sleeve and packing piece.
 - (b) Release and remove the plug from the lower drain body.
 - (c) Remove the four bolts securing the drain valve to the outer case, then remove the valve and gasket.

- (2) Remove the drain valve from the bottom of the outer case (Engines with saddle plate assembly) (Ref. Fig.102A).
 - (a) Remove the nuts from the three eccentric headed bolts and remove the sealing plate, sleeve and packing piece.
 - (b) Release and remove the plug from the lower drain body.
 - (c) Remove the four nuts and locking plate (engines to SB.71-8494-27 standard), then remove the drain valve and gasket.
 - (d) Release the retaining ring and remove the outer saddle piece and gasket.
 - (e) Remove the four bolts and inner saddle piece from inside the outer case.
- (3) Disassemble the drain valve.

CAUTION: THE ASSEMBLY CONTAINS SPRING LOADED VALVES.

- (a) Carefully remove the two nuts and bolts securing the upper and lower drain bodies and lift off one of the bodies.
- (b) Remove the two valves and springs, and if loose, the washers.

OVERHAUL

C. Remove the Heatshields and Brackets (Ref.Fig.103).

NOTE: The heatshields may be removed in any order, but it is recommended that they are removed in sequence.

- (1) Remove the two rows of bolts, flat washers and dampers securing a heatshield to the heatshield at each side, then ease the released heatshield from engagement with the shield at each side.
- (2) Remove the row of bolts, flat washers and dampers securing one of the partly released heatshields, then withdraw the shield disengaging it from the other shield.
- (3) Remove the remaining heatshields in sequence, removing at the same time the channel assembly and bracket which support the additional heatshield. If the additional heatshield (71-32-02/4-10) is still assembled at this stage, remove it and its six sets of bolts, washers and dampers, then remove the three nuts and bolts and the two additional heatshield brackets from the bracket on the flanged connection and the bracket on the spherical joint flange.
- (4) Release and remove from the containment shield the 10 bolts and the heatshield brackets and, if assembled, the distance pieces.
- (5) Release and remove the nuts, bolts and heatshield brackets from the spherical joint flange brackets.

D. Remove Items from the Spherical Joint Flange and the Flange from the Outer Case (Ref.Fig.104).

- (1) Remove the engine power pitot tube assembly.
 - (a) Release and remove the closure nut if assembled to one end of the tube assembly.

OVERHAUL

- (b) Release and unscrew the union nuts securing the tube assembly to the four pitots.
- (c) Release and remove the loop clamps from the tube assembly, then remove the bolt securing each end of the tube assembly and withdraw the assembly.
- (2) Remove the two bolts which secure each of the four engine power pitots and the three brackets (pre-SB.77-3), or single bracket (SB.77-3), then withdraw the pitots and gaskets. Assemble suitable protectors to the pitots and place them in containers.

NOTE: The single bracket, secured to one of the two upper pitots, supports the heat shield panel and the two brackets at the lower positions, (pre-SB.77-3), support the vibration transducer cable.

- (3) Remove the two bolts securing the PNC pitot taking care to remove the union with the bolts. Withdraw the pitot from the joint flange taking care not to damage the flanged pin. Discard the bolts.

NOTE: The removal and installation of the PNC pitot is also detailed in 76-13-03.

- (4) Disassemble the PNC pitot union by compressing the spring using the compressor (Tool 1963), and removing the retaining ring, two filter discs and the restrictor. Release the spring, detach the spring plate and place all the items in a container.

- (5) Remove the two bolts securing the reheat pressure detector connector, then withdraw the connector.

NOTE: The removal and installation of the reheat pressure detector connector is also detailed in 76-13-03.

- (6) Remove the four bolts and the bracket support, the four bolts and blanking cover, and then, at two positions, the four bolts, blanking cover and gasket.
- (7) Remove the five bolts, flanged connection and bracket.
- (8) Remove the nuts, bolts and brackets from the flanges of the outer case/spherical joint flange, then remove the joint flange using a hoist and the lifting fixture (Tool 1965) bolted to the bracket support position and to the blanking position opposite.

SNECMA

OVERHAUL

E. Remove and Disassemble the Rear Cable Assembly
(Ref.Fig.105).

- (1) Detach rear cable from centre cable and free lower end of cable.
 - (a) Remove nuts and bolts securing rear block to bracket.
 - (b) Compress conduit ends and press rear block toward centre block to take up full depth of conduit housings.
 - (c) Without pulling cable and with rear end of conduit compressed, turn rear block, disengage from cable and detach from conduit end.
 - (d) Compress forward end of conduit and withdraw from middle block.
 - (e) Make use of slot in the conduit and slide it off the cable and expose the cable connection.
 - (f) Remove split pin, washer and shouldered pin from centre/rear cable connection and separate the ends.
 - (g) Pre-SB.0L.593-76-9043-72. Remove split guide bush halves.
 - (h) SB.0L.593-76-9043-72. Remove attachment bolt and retaining plate and remove split guide bush halves.
- (2) Withdraw split pin, washer and shouldered pin of cable connection to shaft actuator arm and detach cable.
- (3) Withdraw cable through lower aperture.

F. Remove the Oil Tubes, Air Tubes and Ducts.

- (1) Rotate the stand 90 deg so that the axis of the assembly is horizontal.
- (2) Remove the oil scavenge tube assembly from No.5 vane (Ref.Fig.106).
 - (a) If installed, remove the insulation blanket at the inner end of the scavenge tube by cutting the locking wire.

- (b) Using the wrench (Tool 906) to hold the tube, release and unscrew the rear cover sump pipe union nut, located inside the rear of the inner case, using the wrench (Tool 872). Withdraw the tube assembly from the outside of the vane and the union nut from the tube.
- (c) Remove the nuts securing the seal housing to the outer case, then withdraw the housing and gasket from the bolts.
- (d) On engines to SB.72-20 standard, remove the insulation blankets from the forward end of the rear cover by cutting the locking wire.

NOTE: To gain greater access to the tubes attached to the rear bearing support, the rear cover may be released and withdrawn (Ref.72-52-03 Disassembly). If the rear cover is removed, then the retaining ring and the bearing outer race/rollers must be withdrawn and placed in containers.

- (3) Remove the cold air vent tube from No.5 vane position (Ref.Fig.106 and 107).
 - (a) Remove the nut and bolt clamping the cover to the tube assembly inside the inner case, then remove the two bolts securing the cover to the seal housing. Draw the cover along the tube away from the seal housing to expose the barrel nut.
 - (b) Locate the wrench (Tool 625 or 626) on the barrel nut, then insert the holder (Tool 846) between the wrench and the tube shoulder, and engage it with the flats on the tube. Loosen the nut using the wrench and holder, then unscrew the nut.
 - (c) Withdraw the tube from the seal housing, remove the cover from the tube, then withdraw the tube from the outside of the vane. Remove the seal ring assembly from the barrel nut.
- (4) Remove the oil feed tube assembly from No.6 vane (Ref.Fig.106 and 107).
 - (a) If installed, remove the insulation blanket at the inner end of the oil tube by cutting the locking wire.

DISASSEMBLY

- (b) Remove from inside the inner case the nut and bolt clamping the cover to the tube assembly, then remove the two bolts securing the cover to the seal housing. Draw the cover along the tube away from the seal housing to expose the barrel nut.
- (c) Locate the wrench (Tool 1047 or 1046) on the barrel nut, then insert the holder (Tool 846) between the wrench and the tube shoulder, and engage it with the flats on the tube. Loosen the nut using the wrench and holder, then unscrew the nut.
- (d) Withdraw the tube from the seal housing, remove the cover from the tube, then withdraw the tube from the outside of the vane. Remove the seal ring assembly from the barrel nut, then withdraw the union nut off the tube.
- (e) Remove the three nuts securing the seal housing to the outer case, then remove the housing and gasket.
- (f) Unscrew and remove the jet guard from the end of the tube if SB.72-48 is embodied.
- (5) Remove the cooling air feed duct assembly from No.2 vane position (Ref.Fig.108 and 109).
- (a) Remove the six nuts securing the elbow (if assembled) and the duct to the outer case, then remove the elbow.
- (b) Release and remove from inside the inner case the two nuts and bolts securing the locking plate to the seal housing, then release the seal housing from the duct by removing the two bolts (Pre SB.72-130), or the two nuts using the cranked ring wrench (Tool 1992) to hold the captive bolts if SB.72-130 is embodied.
- (c) Withdraw the duct from the outside of the vane, and the seal housing from the inner case, withdrawing it from the locking plate.
- (d) Withdraw the seal carrier from the bearing support or seal housing and remove the sealing ring from each end of the seal carrier. Release and remove the two bolts and locking plate from the bearing support.

- (6) Remove the hot air vent duct assembly from No.4 vane position (Ref.Fig.108 and 109).
- (a) Remove the six nuts securing the elbow and brackets (if assembled) and the duct to the outer case, then remove the brackets and elbow.
 - (b) Release and remove from the inside of the inner case the two nuts and bolts securing the locking plate to the seal housing, then release the seal housing from the duct by removing the two bolts (Pre SB.72-130) or the two nuts using the cranked ring wrench (Tool 1992) to hold the captive bolts if SB.72-130 is embodied.
 - (c) Withdraw the duct and gasket from the outside of the vane, and the seal housing from the inner case withdrawing it from the locking plate.
 - (d) Withdraw the seal carrier from the bearing support or seal housing and remove the sealing ring from each end of the seal carrier. Release and remove the two bolts and the locking plate from the bearing support.
- (7) Remove the hot air vent duct assembly from No.7 vane position (Ref.Fig.108 and 109).
- (a) Remove the six nuts securing the elbow and brackets (if assembled) and the duct to the outer case, then remove the brackets and elbow.
 - (b) Release and remove from the inside of the inner case the two nuts and bolts securing the locking plate to the seal housing, then release the seal housing from the duct by removing the two bolts (Pre SB.72-130) or the two nuts using the cranked ring wrench (Tool 1992) to hold the captive bolts if SB.72-130 is embodied.
 - (c) Withdraw the duct and gasket from the outside of the vane, and the seal housing from the inner case withdrawing it from the locking plate.
 - (d) Withdraw the seal carrier from the bearing support or seal housing and remove the sealing ring from each end of the seal carrier. Release and remove the two bolts and the locking plate from the bearing support.

OVERHAUL

G. Remove the Turbine Bearing Support (Ref.Fig.110).

NOTE: If the rear cover was removed from the rear bearing support (Ref.para.F.(2)), the support may be released and removed, but it is recommended that the rear cover is reassembled and the lifting equipment used for removing the rear bearing support assembly in accordance with the following procedure.

- (1) If the rear cover is removed, assemble the cover to the bearing housing aligning the locating pin in the housing with the hole in the cover. Ensure that the cover is assembled squarely, so that the oil tube locates correctly in the oil hole in the bearing housing. Assemble the nuts to the protruding bolts, and using the cranked ring wrench (Tool 1584), tighten the nuts.
- (2) Assemble the lifting equipment to the rear cover.
 - (a) Rotate the stand (if required), so that the axis of the assembly is vertical, rear end uppermost.
 - (b) Ensure that the clamps are withdrawn on the lifting fixture (Tool 413), then locate the fixture on the end cover, engage the clamps of the fixture under the end cover flange, then tighten the wingnuts to secure the clamps.
 - (c) Position the support (Tool 420) on the rear flange of the inner case and engage the centre block around the lifting fixture. Tighten the handnut of the fixture against the centre block of the support.
- (3) Remove the nuts and bolts securing the turbine bearing support to the inner case, collecting the nuts from underneath the inner case.
- (4) Connect a hoist to the ring of the lifting fixture and carefully raise the hoist just sufficiently to take up the slack. Unscrew the handnut, and remove the support, then lower the bearing support through the diffuser onto a suitable pallet.

- (5) Remove the hoist, then release the clamps and remove the lifting fixture from the support.

NOTE: The LP turbine bearing support must now be disassembled (Ref.72-52-03 Disassembly).

H. Remove the Outer Case from the Stand (Ref.Fig.111 and 112).

- (1) Assemble the jacking fixture (Tool 299) to the inner case.
 - (a) Ensure that the jacking fixture is resting in its mobile stand (Tool 811), then position the stand under the stand mounting plate aligning the bridge piece with the cutaway parts in the mounting plate.
 - (b) With the clamp plates of the fixture drawn outwards, raise the fixture and locate the clamps over the mounting plate, then tighten the clamp nuts to secure the clamps.
 - (c) Remove the mobile stand from underneath the mounting plate, then screw up on the jacking fixture until the support pad contacts the inner case.
- (2) Release and unscrew the 10 lower retaining bolts on the outer case securing the outer case to the inner case, then withdraw the bolts and locking plates. Remove the trunnion nuts from the vanes.
- (3) Release and unscrew the 10 upper retaining bolts, then withdraw the bolts and hollow pins from the outer case, using the impact puller (Tool 1690) (if required) to remove the pins. Remove the trunnion nuts from the vanes. Unscrew the jacking fixture to break the contact between the inner and outer cases.
- (4) Ensure that the nuts and washers are removed from the lifting fixture (Tool 298), then lower the fixture onto the rear flange of the outer case locating the studs in the flange bolt holes. Secure the fixture with the slave washers and nuts.

- (5) Release the mounting plate clamps securing the outer case. Attach a hoist to the lifting fixture ring, then raise the hoist guiding the outer case off the inner case. Position and lower the case onto a pallet, then disconnect the hoist and release and remove the lifting fixture.

J. Remove the Inner Case from the Stand (Ref.Fig.111).

NOTE: On engines to pre SB.72-8038-181 lifting fixture (Tool 305 or 1953) may be used.

- (1) On engines to pre SB.72-8038-181 standard, locate the lifting fixture (Tool 305) on the rear face of the inner case aligning the bolt holes, then secure the fixture with its captive bolts. On engines to post or pre SB.72-8038-181 standard, ensure that the thumbnuts are unscrewed and the latches are in the 'FREE' position, then lower the lifting fixture (Tool 1953) onto the rear face of the inner case. Rotate the latches to 'LOCKED' and tighten the thumbnuts.
- (2) Attach a hoist to the lifting fixture ring, then operate the hoist and remove the inner case from the support of the jacking fixture. Position and lower the inner case onto a pallet. Disconnect the hoist, then release and remove the lifting fixture.
- (3) If the diffuser is to Pre SB.72-31 standard, unscrew and remove the five blanking plugs, washers and nuts from the cone of the inner case.

K. Remove Remaining Items from the Outer Case (Ref.Fig.112).

- (1) If the engine is to Pre SB.72-31 standard, remove the four nuts from the outside of the case from each of the five blanking covers and remove the covers. Release and remove the exposed nuts and keywashers from each of the blanking cover positions, then remove the external bosses and the internal plates and bolts. Remove the internal and external gaskets (if still attached) from the positions between No.4-5 and 6-7 vanes.

OVERHAUL

- (2) Remove the retaining rings from the eccentric bolts located at No.2, 4, 5, 6 and 7 vanes, removing the rings from the outside of the case, and the bolts from inside the case.
- (3) Remove the bolts securing each of the mounting brackets to the containment shield, then ease the brackets off the pins.
- (4) Screw the lifting handles (Tool 1966) into four equally spaced threaded holes in the containment shield, then lift the containment shield off the outer case and place on a pallet. Remove the bolts from the flange of the outer case and the handles from the shield.

LEFT-HAND GEARBOX - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The left-hand gearbox is received for disassembly with the main oil pump attached. Prior to disassembly of the gearbox, the oil pump must be removed. The gearbox is disassembled in three main stages, the removal of front cover, diaphragm, and gearshafts. With one exception, all gearshafts are removed with the diaphragm. When disassembling the gearshafts, bearings and bearing housings, ensure that the matching components are noted and identified. The main drive shaft is a separate item and must be suitably protected.

2. Prepare to Remove Gears from Gearbox Case

- A. Assemble Gearbox to Assembly Stand (Tool 875) (Ref.Fig.101).
 - (1) Remove the module identification plate from the gearbox and carefully retain the plate with the disassembled components.
 - (2) Assemble the lifting fixture (Tool 285) to the gearbox.
 - (a) Slacken the quick attach/detach (QAD) coupling ring bolt located on the rear face of the gearbox case and remove the protector.
 - (b) Assemble the lifting fixture to the QAD coupling and ensure full engagement with the coupling ring. Tighten the coupling ring bolt.
 - (3) Adjust the stand in preparation to accept the gearbox.
 - (a) Unscrew the locking pin attached to the vertical support and rotate the gearbox mounting adapter until it is in the vertical position. Screw the locking pin into position to lock the adapter.

OVERHAUL

- (b) Assemble the main drive location adapter (Tool 867) to the gearbox mounting adapter and secure it with nuts.
- (4) Attach a crane hoist to the gearbox lifting fixture and position the gearbox in readiness for securing it to the stand.
- (5) Secure the gearbox to the stand with nuts and bolts then remove the lifting fixture from the gearbox.

B. Remove Oil Pump (Ref.Fig.101).

- (1) Remove the bolts securing the pulse probe to the gearbox then carefully withdraw the probe and place it into its container (Tool 1159). Assemble protector (Tool 200) to the pulse probe location. The protector is stored in container (Tool 279).
- (2) Assemble the lifting fixture (Tool 93) to the pump.
 - (a) Remove the cover plate, bracket and protector from the lifting fixture location on the pump.
 - (b) Assemble the lifting fixture to the pump and secure it with bolts.
 - (c) Attach a crane hoist to the fixture in preparation for pump removal.
- (3) Remove the nuts, bolts and load spreading washers securing the pump flange to the gearbox flange.
- (4) Separate the flange joints by the use of puller (Tool 1668) which can be screwed into the tappings near the flanged pins positions. Ensure that residual oil drains into the drip tray.
- (5) Carefully withdraw the oil pump and ensure that the quill shaft does not fall free. Remove the quill shaft and assemble protector (Tool 931) to the joint face of the pump.
- (6) Place the oil pump into container (Tool 1632) and ensure that the quill shaft is protected.
- (7) Remove the lifting fixture from the oil pump and assemble protector (Tool 121) to the location. The protector is stored in container (Tool 279).

OVERHAUL

- (8) Carefully remove the flanged pins from the gearbox/oil pump joint face, and assemble protector (Tool 141) to the gearbox.

C. Remove QAD Couplings (Ref.Fig.102).

NOTE: This procedure applies to the gearbox front cover and gearbox case. Ensure that components are retained as matching items.

- (1) Remove the following items.
 - (a) Coupling ring bolt, spherical washer and protector.
 - (b) Retaining bracket bolts and retaining bracket.
 - (c) QAD coupling flange securing bolts.
 - (d) Coupling flange and seal.
- (2) Place the components in suitable containers.
- (3) Assemble a protector (Tool 146) to each QAD coupling location.

D. Remove Front Cover from Gearbox (Ref.Fig.102).

- (1) Remove the bracket and cover from the oilway on the gearbox cover and assemble protector (Tool 145) to that location.
- (2) Remove the bolts securing the cover to the gearbox case at the flanged pin positions. Use the mechanical puller (Tool 715) and extract the flanged pins.
- (3) Remove the remaining bolts and load spreading washers from the flange. Carefully separate the joint flanges by using puller (Tool 1021 or 1668). Ensure that residual oil drains into the drip tray. Remove the cover and protect the joint face with protector (Tool 140).

3. Remove Gears from Gearbox Case

A. Remove Diaphragm and Gearshafts (Ref.Fig.102).

- (1) Adjust the stand to position the diaphragm horizontally to prevent the loose idler gear from falling free on removal of the diaphragm.

DISASSEMBLY

72-62-00

Page 105

Sep 1/75

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Remove the bolts, nuts and load spreading washers securing the diaphragm to the gearbox case. Use the puller (Tool 177) and withdraw the flanged pins from the diaphragm.
- (3) Carefully withdraw the diaphragm and attached gears from the gearbox. Place the assembly in a container.
- (4) Remove the idler gear from the gearbox and assemble protectors (Tool 191 and 192) to the bearings. Place the assembly in tray (Tool 1229).

4. Disassemble Gearshafts from Diaphragm and Remove Bearings

A. Prepare to Remove Gearshafts (Ref.Fig.103).

- (1) Assemble the diaphragm to the holding fixture (Tool 152) and secure the holding fixture to Hydraclamp (Tool 1643).
- (2) Remove the idler gear bearing track from the centre of the diaphragm.
 - (a) Remove the bolts and load spreading washers securing the track to the diaphragm. Remove the track and place in a container.

B. Remove and Disassemble Fuel Control Unit/Main Oil Pump Driving Shaft from Diaphragm (Ref.Fig.103 Position A).

- (1) Remove the nuts, bolts and load spreading plates securing the shaft bearing to the diaphragm. Remove the shaft from the diaphragm.
- (2) Secure the vice holder (Tool 166) in a bench vice and place the shaft in the vice holder.
- (3) Unlock the bearing retaining nut cupwasher and place the wrench spanner (Tool 1511) on the retaining nut.

CAUTION: HOLD DRIVING SHAFT TO PREVENT IT FROM FALLING FREE WHEN THE RETAINING NUT AND BEARING ARE REMOVED.

- (4) Unscrew and remove the retaining nut, cupwasher and flat washer then withdraw the quillshaft from the centre of the driving shaft, and remove the cupwasher and flat washer. Place the quillshaft in tray (Tool 1229).

- (5) Remove the adjusting washer and locating sleeve. Carefully withdraw the driving shaft and place it in tray (Tool 1229). Place the bearing in a container.
- (6) Remove the bevel gear from the vice holder and place it in tray (Tool 1229). Remove the vice holder from the bench vice.
- (7) Remove the roller bearing from the driving shaft.
 - (a) Secure the vice holder (Tool 167) vertically in a bench vice and place the driving shaft in the holder.
 - (b) Use the wrench spanner (Tool 1487) and remove the bearing retaining nut.
 - (c) Hold the assembly firmly in the vice holder and remove the bearing using the mechanical puller (Tool 223). Place the bearing in a container.
 - (d) Remove the shaft from the vice holder and remove the vice holder from the bench vice. Place the shaft in tray (Tool 1229).
- (8) Remove the oil feed sleeve from the quillshaft (Ref.Fig.104).
 - (a) Remove the retaining ring from the end of the quillshaft.
 - (b) Place the support (Tool 196) on a support plate so that the flange section is supported.
 - (c) Insert the quillshaft in the support then insert the driver (Tool 195) into the quillshaft and carefully remove the sleeve ensuring that it does not fall free on removal.
 - (d) Place the quillshaft in tray (Tool 1229) and remove the support from the bench vice.
- (9) Remove the oil trap sleeve from the oil feed sleeve (Ref.Fig.104).
 - (a) Carefully secure the oil feed sleeve to a bench vice. Ensure that no damage or distortion to the sleeve can occur.

OVERHAUL

- (b) Assemble the mechanical puller (Tool 273) to the oil trap and carefully extract the trap. Remove the puller and place the oil trap and oil feed sleeve in containers.

C. Remove and Disassemble Stage 1 Fuel Pump Drive Gearshaft from Diaphragm (Ref.Fig.105 Position B).

- (1) Remove the retaining ring and oil trap washer from the inside of the shaft opposite to the end attached to the diaphragm.
- (2) Secure the vice holder (Tool 178) in a bench vice, transfer the diaphragm from the Hydraclamp and engage the gearshaft with the splined section of the holder.
- (3) Support the diaphragm assembly. Unlock the bearing cupwasher and using wrench spanner (Tool 1490) remove the retaining nut.

NOTE: The quillshaft within the gearshaft will emerge during removal of the retaining nut.

- (4) Remove the retaining nut, cupwasher and flat washer from the end of the shaft. Withdraw the quillshaft and place in tray (Tool 1229).
- (5) Carefully remove the gearshaft and place in tray (Tool 1229).
- (6) Transfer the diaphragm assembly to the Hydraclamp.

NOTE: The vice holder can remain in the bench vice in preparation for a later stage of disassembly.

- (7) Remove the nut, bolt and load spreading washer assembly securing the gearshaft bearing to the diaphragm. Remove the bearing and place in a container.
- (8) Assemble the gearshaft to the vice holder and remove the roller bearing retaining nut with wrench spanner (Tool 1566).
- (9) Assemble the mechanical puller (Tool 225) for engines Pre.SB.72-9023-403 or (Tool 3150) for SB.72-9023-403 to the bearing and gearshaft then carefully remove the bearing and place in a container.

(10) Place the gearshaft in tray (Tool 1229) and remove the vice holder from the bench vice.

D. Remove and Disassemble Main Drive Gearshaft from Diaphragm (Pre SB.72-383).

- (1) Secure the vice holder (Tool 303) in a bench vice. Transfer the diaphragm from the Hydraclamp and place the gear in the vice holder.
- (2) Support the assembly and using wrench spanner (Tool 1491), remove the self-locking bearing retaining nut and washer SB.72-55.
- (3) Remove the nuts securing the bearing to the diaphragm, then remove the retaining plate and withdraw the gearshaft and bearing from the diaphragm. Place the diaphragm in a container.
- (4) Remove the bearing from the gearshaft and place the bearing in a container. Remove the adjusting washer from the gearshaft.
- (5) Remove the bevel gear if it is loosely assembled to the gearshaft.

CAUTION: DO NOT APPLY FORCE TO SEPARATE BEVEL GEAR FROM GEARSHAFT.

- (6) If SB.72-9 Part 3 is not embodied, release and remove the spur gear from the bevel gear.
- (7) Remove the roller bearing retaining nut from the gearshaft with wrench spanner (Tool 1509).
- (8) Assemble the mechanical puller (Tool 229) to the bearing and carefully remove the bearing from the gearshaft.
- (9) Remove the puller from the bearing, then place the bearing in a container. Place the gearshaft in a tray (Tool 1229). Remove the vice holder from the bench vice.

- E. Remove and Disassemble Main Drive Gear Assembly from Diaphragm (SB.72-383).
 - (1) Secure the vice holder (Tool 303) in a bench vice. Transfer the diaphragm from the Hydraclamp and place the gear in the vice holder.
 - (2) Support the assembly and using wrench spanner (Tool 1491), remove the self-locking bearing retaining nut.
 - (3) Remove the nuts securing the bearing to the diaphragm, then remove the retaining plate and withdraw the gear assembly and bearing from the diaphragm. Place the diaphragm in a container.
 - (4) Remove the bearing from the gear assembly and place the bearing in a container. Remove the adjusting washer from the gear assembly.
 - (5) Remove the roller bearing retaining nut from the gear assembly with wrench spanner (Tool 1509).
 - (6) Assemble the mechanical puller (Tool 229) to the bearing and carefully remove the bearing from the gear assembly.
 - (7) Remove the puller from the bearing, then place the bearing in a container. Place the gear assembly in a tray (Tool 1229). Remove the vice holder from the bench vice.

5. Remove Bearings from Idler Spur Gear

A. Remove Small Diameter Bearing Assembly.

- (1) Secure the vice holder (Tool 304) in a bench vice and place the idler gear in the holder. Position the smaller bearing retaining nut uppermost.
- (2) Using the wrench spanner (Tool 1509) remove the small retaining nut.

- (3) Assemble the mechanical puller (Tool 224) to the small bearing/gearshaft then remove the bearing and place it in a container. Do not remove the vice holder.

B. Remove Large Diameter Bearing Assembly.

- (1) Invert the idler gearshaft in the vice holder then using wrench spanner (Tool 1566) remove the large retaining nut.
- (2) Assemble the mechanical puller (Tool 225) to the bearing/gearshaft then remove the bearing and place it in a container.
- (3) Place the gearshaft in tray (Tool 1229). Remove the vice holder from the bench vice.

6. Disassemble Bevel Gear Pinions from Gearbox

A. Remove Oil Pump Drive Bevel Pinion (Ref.Fig.106).

- (1) Insert the immobiliser (Tool 331) in the bevel pinion, ensuring full engagement of the splines.
- (2) Engage the immobiliser bar with the hole in the immobiliser plate (Tool 332). Secure the plate to the gearbox case.
- (3) Unlock the retaining nut cupwasher in the oil pump section of the gearbox case.
- (4) Assemble the support plate (Tool 800) to the oil pump location flange. Insert the wrench spanner (Tool 1486) through the support plate and engage it with the bevel gear pinion retaining nut. Carefully unscrew and remove the retaining nut.
- (5) Remove the immobiliser plate, immobiliser and support plate.
- (6) Assemble the mechanical puller (Tool 213) to the oil pump location flange on the gearbox case. Adjust the handle to establish contact between the tool and the end of the bevel gear pinion.
- (7) Carefully remove the bevel pinion from the bearing then remove the adjustment washer from the pinion. Place the gear in tray (Tool 1229).

(8) Remove the nuts, bolts and load spreading washers securing the bearings to the case. Withdraw the bearings and remove the spacer sleeve.

(9) Place each bearing in a container.

B. Remove Main Drive Shaft Spiral Bevel Pinion (Ref. Fig.107).

(1) Assemble the immobiliser (Tool 168) to the gearbox main drive mounting location on the assembly stand mounting plate.

(a) Engage the tool with the bevel pinion retaining nut.

(b) Secure the immobiliser plate to the mounting plate.

(2) Insert the splined wrench spanner (Tool 1558) through the centre of the immobiliser and engage the splines with the bevel pinion.

(3) Turn the splined wrench spanner in a clockwise direction to unscrew and release the bevel pinion.

(4) Remove the splined wrench spanner and immobiliser from the gearbox case.

(5) Assemble the mechanical driver (Tool 220) to the location from which the immobiliser was removed. Turn the handle of the tool until the bevel pinion is completely removed from the bearing. Place the bevel pinion in tray (Tool 1229).

NOTE: For pre SB.72-383 follow paras.(6) and (7) for SB.72-383 follow para.(8).

(6) Remove the nuts, bolts and washers securing the bevel gear bearing and oil jets to the gearbox case. Remove the bearing assembly and oil jets. Place the oil jets in a suitable container.

(7) Separate the bearings to remove the spacer sleeve and adjustment washer.

(8) Remove the nuts, bolts and washers securing the bevel gear bearing and oil jets to the gearbox case. Remove the bearing assembly, oil jets and adjusting washer. Place the oil jets in a suitable container.

(9) Place each bearing in a container.

7. Disassemble Components from Gearbox Case and Front Cover

A. Remove Components from Gearbox Case (Ref.Fig.108).

- (1) Remove the bolts securing the bearing journals to the gearbox case, then remove the journals and place them with the matching bearings in suitable containers.
- (2) Disassemble the bearing journal at the fuel control unit drive shaft location.
 - (a) Remove the bolt securing the oil jet to the QAD coupling location on the rear face of the gearbox case.
 - (b) Remove the three nuts and bolts securing the bearing housing to the gearbox case. Withdraw the journal and place in a suitable container.
- (3) Unscrew and remove the oil jet from the inner surface of the gearbox case. Place the oil jet in a suitable container.
- (4) Remove the hollow pin and oil strainer assembly from the gearbox case/cover flange.
 - (a) Use puller (Tool 154) with the impact puller (Tool 1653) then remove the hollow pin.
 - (b) Use puller (Tool 156) with the impact puller (Tool 1653) and remove the oil strainer assembly positioned under the hollow pin.
 - (c) Remove the oil jet SB.72-32 from the strainer and place both items in suitable containers.
- (5) Use puller (Tool 154) with the impact puller (Tool 1653) and remove the remaining hollow pin from the flange.
- (6) Release the retaining rings securing the diaphragm bolts to the flange then withdraw the bolts.
- (7) Remove the cover and bracket from the oilway near the QAD coupling location on the rear of the gearbox case. Remove the oil jet and strainer assembly.
 - (a) Screw the puller (Tool 155) into the end of the strainer assembly and withdraw the assembly. If necessary the puller can be used in conjunction with the impact puller (Tool 1653).

- (b) Remove the oil jet from the strainer and place both items in suitable containers.
 - (c) Assemble protector (Tool 142) to the strainer location on the gearbox.
- (8) Disassemble the rear cover from the gearbox case.
- (a) Remove the bolts and load spreading washers. Withdraw the flanged pins with the mechanical puller (Tool 715).
 - (b) Separate the joint flanges by using the puller (Tool 1668) in the extraction holes then remove the cover. Assemble protector (Tool 204) to the rear cover location on the gearbox. The protector is stored in container (Tool 279).
- (9) Remove the end-plate, flanged connector and associated items from the end of the gearbox case near the rear cover. Assemble protector (Tool 198) to the gearbox.
- (10) Remove the stepped pins from the QAD coupling location.
- (11) Remove the protector from the QAD coupling location and assemble the lifting fixture (Tool 313) to the gearbox. Remove the gearbox from the assembly stand and assemble protector (Tool 199) to the main drive location on the gearbox.
- (12) Place the gearbox on a transport pallet and remove the lifting fixture from the gearbox. Assemble the previously removed protector to the QAD coupling location.

B. Remove Components from Front Cover (Ref.Fig.109).

- (1) Remove protectors from the front cover then assemble the holding fixture (Tool 151) to the front cover and secure the assembly in a Hydraclamp.
- (2) Unscrew and remove the plug (Ref.Fig.109 Position A). Place the plug in a suitable container.
- (3) Remove the filter and connector (Ref.Fig.109 Position B).
 - (a) Release the bolt securing the retaining cap and withdraw the retaining cap.

MK.610-14-28
OVERHAUL

- (b) Screw the puller (Tool 158) into the connector and withdraw the assembly from the bore.
- (c) Clamp the vice holder (Tool 159) in a bench vice in preparation for disassembly of the filter and connector.
- (d) Place the filter in the vice holder and ensure that the slot in the end of the filter engages with the pin in the bore of the tool. Remove the connector from the filter.
- (f) Remove the filter from the vice holder and place the components in suitable containers.
- (g) Remove the vice holder from the bench vice.
- (4) Remove the filter assembly (Ref.Fig.109 Position C).
- (a) On engines to Pre SB.72-12 standard remove the bolt securing the retaining cap to the cover. Use the driver (Tool 1484) to withdraw the retaining cap. Screw the puller (Tool 158) into the oil jet located in the bore and withdraw the oil jet and filter assembly. Remove the puller from the oil jet.
- (b) On engines to SB.72-12 standard remove the bolt and washer securing the oil jet sealing plug to the cover. Use the driver (Tool 1484) to withdraw the sealing plug and filter assembly from the bore. Remove the driver from the sealing plug.
- (c) Place the oil jet and filter assembly or oil jet sealing plug and filter assembly in the vice holder (Tool 159). Ensure that the slot in the end of the filter engages with the pin in the bore of the tool. Use the turning key (Tool 1485) unscrew and remove the oil jet or oil jet sealing plug from the filter. Place the components in clean sealed containers.

OVERHAUL

- (5) Release the bolts securing the oil jet (Ref.Fig.109 Position D), then remove the oil jet and place in a suitable container.
- (6) Unscrew and remove the oil jet (Ref.Fig.109 Position E). Place the oil jet in a suitable container.
- (7) Carefully remove the stepped pins from the QAD coupling location and adjacent bracket position.
- (8) If SB.72-9 Parts 1 and 2 are not incorporated, release and remove the three bolts securing each of the two bearing outer tracks, then withdraw the outer tracks from the cover (Ref.Fig.109 Position A and below - outer tracks not illustrated).

NOTE: It is recommended that SB.72-9 is incorporated and the redundant outer tracks and spur gear (Ref.para. 4.D.(6)) are deleted from the assembly.

- (9) Disengage the assembly from the clamp and remove the holding fixture from the cover.
- (10) Assemble protectors (Tool 146 and 140) to the cover.

OVERHAULRIGHT-HAND ACCESSORY GEARBOX - DISASSEMBLY1. General

- A. Prior to commencing the disassembly refer to 72-09-00 Disassembly for general information.
- B. The right-hand gearbox will be received, on a pallet, from the intermediate case disassembly (72-32-00). During disassembly, drain trays must be suitably positioned to accept the small leakage of oil which will be present.
- C. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- D. During disassembly, individual items are to be identified, adjusting washers placed with their correct assembly and all items placed into containers.

2. Disassemble the Right-hand Accessory Gearbox

- A. Remove the Integrated Drive Generator (IDG) Quick Attach/Detach (QAD) Coupling Ring Assembly and Mounting Bracket.
 - (1) Remove the protector (Tool 792) from the location of the QAD coupling (Ref.Fig.101).
 - (2) Unscrew and remove the locking bolt from the coupling ring and mounting bracket. Remove the spherical washer from the bolt.
 - (3) Unscrew and remove the 32 bolts securing the flange and coupling ring to the gearbox case.

OVERHAUL

CAUTION: THE CORRUPPLUS SEAL (Pre.SB.OL.593-72-8995-401) OFTEN FRETS AND DAMAGES ITS SEALING FACE. IN ORDER TO PREVENT DAMAGE TO THE 'O' RING (SB.OL.593-72-8995-401) IT MAY BE NECESSARY TO POLISH THE SURFACE BACK TO ITS ORIGINAL SURFACE FINISH OF 32 MICRO-INCHES (0,8 MICRO-METRES) BEFORE FITTING THE 'O' RING. THE GROOVE MUST NOT BE MADE DEEPER THAN ITS DRAWING DIMENSIONS (REF.FIG.101) OR THE CONSEQUENT REDUCTION IN SEAL NIP MAY RESULT IN LEAKAGE.

- (4) Remove and separate, both flange and coupling ring from the gearbox case, then remove the Corruplus seal (Pre.SB.OL.593-72-8995-401) or the 'O' ring (SB.OL.593-72-8995-401) from the flange.
- (5) Remove the gasket from the flange mounting face.
- (6) Unscrew and remove the two self-locking nuts, load spreading washers and bolts securing the mounting bracket to the gearbox case, then remove the mounting bracket and bracket from the gearbox case.

B. Assemble the Gearbox to the Build Stand (Ref.Fig.102).

- (1) Assemble and secure the lifting adapter (Tool 794) to its location on the gearbox case close to the main and stand-by hydraulic pump mounting locations.
- (2) Assemble and secure the lifting adapter (Tool 793) to its location on the gearbox case close to the inclined bevel gear drive assembly mounting location.
- (3) Assemble the lifting fixture (Tool 827) to the centre of the top slot in the lifting fixture (Tool 795) and secure the two fixtures together with the captive bolt, washer and nut.
- (4) Attach a hoist to the lifting fixture and position the fixture close to the adapters assembled to the gearbox case. Ensure that the lifting plate with the locking pin and fulcrum pin (part of fixture (Tool 795)) is next to the adapter (Tool 793). Unscrew and remove the locking pin then screw both fulcrum pins in to their respective adapters.

- (5) Raise the hoist until the gearbox is supported, then turn the gearbox so that the IDG mounting face is at the bottom. Engage and screw the locking pin through the lifting fixture in to the adapter (Tool 793).
 - (6) Raise the hoist and position the IDG mounting face to the build stand (Tool 494) such that on the assembly of the immobilizer (Tool 540) to the triangularly spaced tapped holes in the build stand, the splined shaft of the immobilizer will lie on the centre line of the hydraulic pumps drive shaft in the gearbox case. Locate and secure the gearbox case to the build stand with the 32 captive bolts.
 - (7) Release and remove the lifting fixture from the adapters and hoist then release and remove the two adapters from the gearbox.
- C. Remove the Pressure and Scavenge Filters from the Gearbox Case.
- (1) Remove the pressure filter
(Pre S.B.0L.593-72-9036-419) (Ref. Fig.103).
 - (a) Using the adapter (Tool 555) unscrew and remove the magnetic plug and Corrujoint seal from the filter cover assembly.
 - (b) Unscrew and remove the locking bolt and spherical washer from the bracket and nut assembly.
 - (c) Rotate the nut assembly through 30 deg to unlock, remove the nut then withdraw the cover, spring and filter assembly from the adapter. Remove, by unscrewing, the filter and spring from the cover.
 - (d) Unscrew and remove the six bolts securing the bracket and adapter to the gearbox case. Remove the bracket and adapter, then remove both seals from the adapter.
 - (e) Unscrew and remove the valve body and restrictor plug from the gearbox case.
 - (2) Remove the pressure filter (SB.0L.593-72-9036-419) (Ref. Fig.104).
 - (a) Unscrew and remove the locking bolt and spherical washer from the bracket and nut assembly.

- (b) Rotate the nut assembly through 30 deg. to unlock, remove the nut then withdraw the cover, spring and filter assembly from the adapter. Remove, by unscrewing, the filter and spring from the cover.
- (c) Unscrew and remove the six bolts securing the bracket and adapter to the gearbox case. Remove the bracket and adapter, then remove both seals from the adapter.
- (d) Unscrew and remove the valve body and restrictor plug from the gearbox case.

CAUTION: ON PARTS TO SB 0L.593-72-9036-419 STANDARD, IT MAY BE NECESSARY (DUE TO THE POSSIBLE ADHERENCE OF THE "O" RING TO THE JOURNAL) TO USE CONVENTIONAL HAND TOOLS TO AID THE REMOVAL OF THE MCD BODY ASSEMBLY, AS PART OF THE FILTER REMOVAL SEQUENCE. DURING THIS OPERATION IS IS ESSENTIAL THAT EXTREME CARE IS TAKEN, SO AS TO NOT DAMAGE ANY PART OF THE ASSEMBLY.

- (3) Remove the scavenge filter
(Pre S.B.0L.593-72-9036-419) (Ref. Fig.103).
(S.B.0L.593-72-9036-419) (Ref. Fig.104).
- (a) Unscrew and remove the magnetic plug from the filter cover assembly.
- (b) Unscrew and remove the locking bolt and spherical washer from the bracket and nut assembly.
- (c) Rotate the nut assembly through 30 deg to unlock, remove the nut then withdraw the drain valve body, spring and filter assembly from the oil filter adapter. Remove, by unscrewing, the filter and spring from the valve body.
- (d) Unscrew and remove the six bolts securing the bracket and filter adapter to the gearbox case, then remove the bracket and adapter from the case.
- (e) Remove the seals from the grooves in the adapter.

OVERHAUL

- (b) Locating the bevel gear teeth with the teeth in the immobilizer and the three studs on the immobilizer with the corresponding holes in the bearing housing, position the assembly into the immobilizer. Secure the assembly to the immobilizer with three nuts (Tool 537).
- (c) Unscrew and remove the bearing housing assembly nut using the wrench.
- (d) Withdraw the keywasher, flexible coupling shaft and spacer sleeve then unscrew and remove the three securing nuts and remove the bearing housing from the immobilizer.
- (4) Withdraw the spacer sleeve from the flexible coupling shaft using the mechanical puller (Tool 743) (Ref.Fig.106).
 - (a) Locate the slotted body of the mechanical puller on the shaft and the puller extractor to the lip at the end of the spacer sleeve.
 - (b) Operate the thrust screw and withdraw the spacer sleeve from the shaft.
 - (c) Release and remove the mechanical puller.
- (5) Locate the bearing housing assembly, bevel gear teeth on the underside, on the support (Tool 717). With the driver (Tool 716) located in the gear shaft, press from the bearing housing, the gear, inner ring of the flanged roller bearing, adjusting washer and one half of the inner ring of the ball bearing. Remove the bearing housing from the support.
- (6) Remove the two inner bearing rings and the adjusting washer from the bevel gear using the mechanical puller (Tool 723) (Ref.Fig.107).
 - (a) Locate the claws of the mechanical puller in the three slots in the bevel gear wheel and under the bearing inner ring.
 - (b) Lock the claws into their locations by tightening the mechanical puller adjusting nut.

- (c) Operate the thrust screw and locate the puller pad into the internal circumference of the bevel gear drive shaft, continue to screw in the thrust screw and extract the two inner bearing rings and the adjusting washer.
- (d) Release and remove the mechanical puller.
- (7) Unscrew and remove the three 'D' headed bolts and self-locking nuts securing the flanged outer ring of the roller bearing to the inclined bevel gear bearing housing.
- (8) Remove the bearing outer ring, adjusting washer, one half of the inner ring and the outer ring of the ball bearing, inner and outer adjusting washers and the inner track of the roller bearing from the bearing housing.
- (9) Remove the outer ring of the roller bearing from the bearing housing using the support (Tool 685) and driver (Tool 686).
 - (a) Locate the bearing housing on the support and position the support on the base of a hand press.
 - (b) Engage the three points of the triangularly shaped driver (Tool 686) into the three cutaways in the lip on the end face of the bearing housing.
 - (c) Press the outer ring of the roller bearing from the bearing housing.
 - (d) Remove the support and the driver.
- E. Remove the Oil Pressure Switch and Transmitter (Pre SB. 72-96), or Covers (SB.72-96), from the Gearbox Front Cover (Ref.Fig.108).
 - (1) Unscrew and remove the seven bolts securing the oil pressure switch or cover to the gearbox front cover. Remove the switch or cover from the front cover and remove the Corruplus seals from the grooves in the mounting face of the switch or cover.
 - (2) Unscrew and remove the seven bolts securing the oil pressure transmitter or cover to the gearbox front cover. Remove the transmitter or cover from the cover and remove the Corruplus seals from the grooves in the mounting face of the transmitter or cover.

F. Remove the Starter QAD Adapter from the Gearbox Front Cover (Ref.Fig.108).

- (1) Unscrew and remove the locking bolt from the coupling ring and mounting bracket, then remove the spherical washer from the bolt.
- (2) Unlock the coupling ring (Ref.72-09-00, Disassembly), then release and remove the protector (Tool 778) from the starter QAD coupling.
- (3) Unscrew and remove the 13 bolts securing the flange to the front cover, then remove the three flanged pins from the flange.
- (4) Remove the flange and coupling ring from the front cover. Separate the coupling ring from the flange.
- (5) Remove the gasket from the flange mounting face.
- (6) Unscrew and remove the two bolts securing the mounting bracket to the front cover, then remove the bracket.

G. Remove the Front Cover from the Gearbox Case (Ref.Fig.108).

- (1) Unscrew the 56 bolts securing the front cover to the gearbox case then remove the bolts, 53 washers and brackets from the cover.
- (2) Remove the three hollow pins from their locations in the front cover using mechanical puller (Tool 715) (Ref.Fig.108 and 109).
 - (a) Locate the shroud of the mechanical puller around the hollow pin.
 - (b) Insert the puller quill into the pin and lock by tightening the spindle.
 - (c) Operate the extractor screw and withdraw the pin from the cover, then release and remove the puller from the pin.
- (3) Locate and screw in a locating pin (Tool 526, 527 and 528) into each hole vacated by a hollow pin.
- (4) Locate the extraction holes around the cover. Insert and engage a puller (Tool 1668) into each hole. Operate the pullers and withdraw the cover from the case.

- (5) Remove the pullers from the front cover. Locate and screw the two captive bolts of the lifting fixture (Tool 1867) into two of the holes vacated by the pullers. Attach a hoist to the lifting fixture then raise the hoist and remove the front cover from the gearbox case. Position the cover on a work surface, taking care not to damage the oil pump drive shaft, then remove both the hoist and lifting fixture.
- (6) With the front cover holding fixture (Tool 430) in the horizontal position (Ref.Fig.110) secured to the Hydraclamp, locate the oil pressure switch and transmitter mounting faces of the front cover on the holding plate, secure the cover to the plate, with the 14 captive bolts.

H. Remove the Oil Pump from the Front Cover.

- (1) Unscrew and remove the seven bolts and washers securing the hand turning shaft cover blank to the front cover, refer to Fig.108, then remove the blank from the cover and the gasket from the blank.
- (2) Unscrew and remove the self-locking nut securing the hand turning shaft (Ref.Fig.110).
 - (a) Locate the immobilizer (Tool 787) onto the oil pump drive shaft and position both blocks of the immobilizer on the front cover mounting face. Insert the two securing bolts, from the under-side, through the cover flange and engage their respective threaded holes in the immobilizer. Tighten the bolts and secure the immobilizer to the cover.
 - (b) Unscrew and remove the self-locking nut, hand turning shaft end, then remove the hand turning shaft.
 - (c) Unscrew the two captive bolts securing the immobilizer, remove the immobilizer and withdraw the oil pump drive shaft.
- (3) Unscrew and remove the eight bolts and washers securing the scavenge oil pump assembly to the front cover.
- (4) Remove the oil pump assembly using the mechanical puller (Tool 969) (Ref.Fig.111).

OVERHAUL

- (a) Disengage the bridge of the puller and swing the leg into the horizontal position.
- (b) Locate the puller onto the pump body and swing the leg into the vertical position. Engage the bridge and tighten the screwjack, so clamping the pads, on the two legs, onto the sides of the pump body.
- (c) Apply a vertical force to the handle on the puller and remove the pump body from the front cover.

NOTE: If difficulty is experienced in removing the pump body, the impact puller (Tool 1653) can be engaged in the handle of the mechanical puller.

- (d) Disengage and remove the mechanical puller from the pump body.
- (5) Remove the cover from the pump case and withdraw the two scavenge spur gears from the case.
- (6) On engines Pre-SB.72-23 remove the two pressure pump spur gears, on engines embodying SB.72-23 remove the blanks from the front cover.
- (7) Should it be necessary to remove the two hollow pins from the pump body, on engines embodying SB.72-2, use the mechanical puller (Tool 902).

J. Remove the Jets and Bearings from the Front Cover Inner Face (Ref.Fig.110).

- (1) Unscrew and remove the three bolts securing the flanged roller bearing outer ring to the vertical bevel gear drive location then withdraw the outer ring.
- (2) Unscrew and remove the bolt securing the oil jet to the location near the vertical bevel gear drive location, then withdraw the jet.
- (3) On engines Pre-SB.72-23 remove the oil jet and filter using the impact puller (Tool 1653) from the oil pump mounting face.
- (4) Remove the jet from the filter.

OVERHAUL

PRINTED IN ENGLAND

- (a) Secure the support (Tool 431) in a bench vice.
 - (b) Lower the filter into the support and engage the castellations on the filter with those in the support.
 - (c) With the wrench (Tool 456) unscrew and remove the jet from the filter, then remove the filter from the support and the support from the vice.
- (5) On engines embodying SB.72-23 remove the plug using the impact puller (Tool 1653) from the oil pump mounting face.
 - (6) Unscrew and remove the three bolts securing the flanged roller bearing outer ring and its retaining ring to the starter drive location, then remove both from the case.
 - (7) Should it be necessary to remove the two hollow pins from the oil pump mounting face use the puller (Tool 1868).

K. Remove the Relief Valve Blank from the Front Cover.

- (1) Using the crowfoot wrench (Tool 1579 Pre-SB.72-8 or Tool 1972 SB.72-8) unscrew and remove the relief valve cap and Corruplus seal from its location on the front cover. Separate the Corruplus seal and the relief valve cap.
- (2) Using the wrench (Tool 1477) unscrew and remove the retaining sleeve from its location in the front cover, then remove the blanking plate.

L. Assemble the Protectors to the Gearbox Front Cover.

- (1) Unscrew the 14 captive bolts of the adapter (Tool 430) and remove the front cover.
- (2) Reassemble the cover blank to the hand turning gear mounting face and temporarily retain with suitable bolts.
- (3) Position the protectors (Ref.Table 101) to their respective locations and retain with their respective captive bolts (Ref.Fig.112).

- (4) Place the front cover into the container (Tool 510).
- M. Remove the Oil Transfer Assembly from the Gearbox (Ref.Fig.113).
- (1) Remove the bolt and retaining sleeve securing the splined shaft to its location in the end of the starter/IDG spur gear drive, as viewed from the IDG mounting location.
 - (a) Locate the splined spigot on the immobilizer (Tool 669) into the corresponding splines on the internal circumference at the starter mounting end of the spur gear drive assembly.
 - (b) Engage the captive bolts in the immobilizer strap with the corresponding thread inserts in the front cover mounting face location on the gearbox case.
 - (c) Unscrew and remove the retaining bolt and sleeve.
- NOTE: The immobilizer (Tool 669) is left assembled to the spur gear drive and gearbox case at this stage in the gearbox disassembly.
- (2) Withdraw the splined shaft from its location in the starter/IDG spur gear drive, then remove the two sealing rings from the grooves in the shaft.

- (3) Unscrew and remove the 12 self-locking nuts securing the oil housing and jet body to their location on the IDG gear drive shaft support bearing mounting face on the gearbox case, then remove the jet body.
 - (4) Remove the oil housing, floating key-ring, oil metering plate and transfer sleeve from their location around the starter/IDG drive shaft using the puller (Tool 1700) (Ref.Fig.114).
 - (a) Assemble the ring of the puller to the oil housing and secure with its two captive bolts.
 - (b) Position the bridge piece across the aperture in the build stand and engage the four captive bolts in the bridge piece with their respective holes in the ring.
 - (c) Screw in the four bolts and withdraw the housing from its location, remove the puller from the gearbox and the housing from the ring.
 - (d) Remove the key-ring, metering plate and transfer sleeve then remove the two sealing rings from the sleeve.
- N. Remove the Starter/IDG Spur Gear Drive Shaft and Bearing Assemblies from the Gearbox.
- (1) Using the depeening tool (Tool 1336) depeen the key-washer retaining the nut at the IDG mounting end of the starter/IDG drive shaft.
 - (2) Unscrew and remove the nut and keywasher from the starter/IDG spur gear drive shaft using the wrench (Tool 670).
 - (a) Remove the wrench from the nut and release and remove the immobilizer (Tool 669) assembled to the starter mounting end of the starter/IDG spur gear drive (Ref.para.M.(1) (a) and (b)).
 - (3) Remove the starter/IDG spur gear shaft assembly, using the mechanical driver (Tool 724), from the flanged ball bearing assembled to the gearbox case (Ref.Fig.115).
 - (a) Locate the three claws of the driver to the lip on the flanged ball bearings inner ring, as viewed through the IDG mounting location.

- (b) Lock the claws into their location by tightening the adjusting nut on the driver.
 - (c) Operate the thrust screw, ensuring that the pad of the driver is located in the internal circumference of the spur gear drive shaft and press the spur gear drive shaft out of the bearing.
 - (d) Remove the spur gear drive shaft from the gearbox.
 - (e) Unlock the three claws and remove the mechanical puller from the flanged ball bearing.
- (4) Using the depeening tool (Tool 1336) depeen the keywasher retaining the nut to the starter mounting end of the starter/IDG spur gear drive.
- (5) Remove the nut using the wrench (Tool 653) and holder (Tool 654) from the starter/IDG spur gear drive.
- (a) Assemble the holder into a bench vice.
 - (b) Ensuring the correct engagement of the splines on the holder with the splines on the internal circumference of the spur gear drive shaft, locate the drive shaft (opposite end to that of the nut to be released) to the holder.
 - (c) Using the wrench unscrew and remove the nut.
 - (d) Remove the wrench from the nut and the spur gear drive assembly from the holder.
- (6) Remove the keywasher from the spur gear drive shaft.
- (7) Remove the bearing (inner ring and rollers) from the starter/IDG spur gear drive shaft using the mechanical puller (Tool 735) (Ref.Fig.116).
- (a) Locate the three claws of the puller under the bearing inner ring and into the three cutaways in the shaft.
 - (b) Lock the claws into their location by tightening the adjusting nut on the puller.
 - (c) Operate the thrust screw, ensuring that the pad on the puller is located in the spur gear drive shaft, and withdraw the inner bearing ring from the shaft.

- (d) Unlock the three claws and remove the mechanical puller.

P. Remove the Vertical Bevel Gear Drive Assembly from the Gearbox.

- (1) Unscrew and remove the three bolts securing the bearing housing (as assembled to the base of the vertical bevel gear drive) to the gearbox case (Ref.Fig.117).

NOTE: Access to the bolts is gained through the aligned holes in the bevel and driving spur gears.

- (2) Withdraw the vertical bevel gear drive assembly, from the gearbox case.
- (3) Remove the flanged outer ring of the roller bearing and the adjusting plate from the gearbox case.
- (4) Remove the nut using the holder (Tool 658) and wrench (Tool 657) from the vertical bevel gear drive shaft (Ref.Fig.118).
- (a) Assemble the holder in a bench vice.
- (b) Position the spur gear into the holder and locate the pin on the holder with any one of the three access holes in the driving spur gear wheel.
- (c) Retain the gear wheel in the holder with the two holder clamp plates, locked with their respective thumbnuts.
- (d) Using the wrench unscrew and remove the nut from the drive shaft. Remove the holder and the wrench.
- (5) Remove the inner ring of the roller bearing, the ball bearing, bearing housing and the adjusting washer from the base of the vertical bevel gear drive shaft using the mechanical puller (Tool 736) (Ref. Fig.118).
- (a) Locate the three claws of the puller under the adjusting washer and into the three cutaways in the bevel gear wheel.

- (a) Ensure the bushes are clear of the three claws of the puller and locate the claws through the three access holes in the bevel gear.
- (b) Locate the bushes into the access holes in the bevel gear, this will now place the claws, on the underside of the bevel gear, into the required position.
- (c) Operate the thrust screw, ensuring the pad on the puller is located in the internal circumference of the shaft and withdraw the bevel gear from the shaft, then release and remove the puller from the bevel gear.

Q. Remove the Main and Stand-by Hydraulic Pump Sealol Seals, and Adapter Assemblies from the Gearbox (Ref.Fig.120).

- (1) Unscrew and remove the two self-locking nuts, lock and spherical washers from the inner and outer eye-bolts retaining the clench clamp to the main hydraulic pump blank and adapter.

NOTE: The nuts must be replaced on the respective inner and outer eye-bolts from which they were removed.

- (2) Remove the clench clamp and blank from the adapter then remove the sealing ring from the blank.
- (3) Unscrew and remove the bolt, keywasher and parking bracket from their location on the stand-by hydraulic pump blank.
- (4) Unscrew and remove the two self-locking nuts lock and spherical washers from the inner and outer eye-bolts retaining the clench clamp to the stand-by hydraulic pump blank and adapter.

NOTE: The nuts must be replaced on the respective inner and outer eye-bolts from which they were removed.

- (5) Remove the clench clamp and blank from the gearbox case then remove the sealing ring from the blank.
- (6) Using the depeening tool (Tool 1336) depeen the keywasher located on the main hydraulic pump drive end of the spur gear shaft.

- (7) Remove the nut located on the main hydraulic pump driving end of the spur gear shaft using the immobilizer (Tool 540) guide (Tool 1608) and wrench (Tool 1525).
- (a) Engage the splines on the immobilizer with the splines on the internal circumference of the shaft. (Stand-by hydraulic pump end).
 - (b) Locate the three triangularly spaced holes in the immobilizer plate with the corresponding tapped holes in the build stand (Tool 494). Retain the immobilizer to the stand with the three captive bolts.
 - (c) Assemble the guide to the wrench.
 - (d) Locate the lugs on the wrench with the corresponding castellations on the nut and the hole in the guide with the stepped pin in the main hydraulic pump adapter.
 - (e) Unscrew and remove the nut and keywasher from the shaft.
 - (f) Remove the guide and wrench. Unscrew the three captive bolts and remove the immobilizer.
- (8) Using the cranked wrench (Tool 645) unscrew and remove the 16 bolts securing the main hydraulic pump adapter and bracket to the gearbox case, then remove the adapter, Corruplus seal, adjusting washer and Sealol seal from the gearbox case.
- (9) Remove the Corruplus seal from the mounting face of the adapter.
- (10) Remove the Sealol seal from the main hydraulic pump adapter using the support (Tool 707) and driver (Tool 708).
- (a) Position the adapter on the support ensuring that the lip of the support is located in the Sealol seal.
 - (b) Position the driver onto the adapter flange and press the Sealol seal from its location in the adapter.
 - (c) Remove the driver and the support.

- (e) Unlock the three claws and remove the mechanical puller.

R. Remove the Idler Gear Oil Pump Drive Gear and their Associated Bearing Assemblies from the Gearbox Case.

- (1) Remove the self-locking nut securing the idler gear and the idler shaft in the gearbox case using the immobilizer (Tool 642) and wrench (Tool 643) (Ref.Fig.121).
 - (a) Locate the lugs on the immobilizer with the corresponding castellations in the self-locking nut and the five holes in the immobilizer body with four of the IDG support bearing housing securing 'D' headed bolts and the headless pin. Secure the immobilizer to the 'D' headed bolts with four slave nuts.
 - (b) Locate the spigot on the wrench into the internal bore of the idler shaft and the three equi-spaced lugs on the wrench into the corresponding cutaways in the idler shaft.
 - (c) Turn the wrench in a counter-clockwise direction in order to unscrew the nut held by the immobilizer. Remove the wrench then the immobilizer and nut.
- (2) Remove the side plate of the flanged roller bearing from the gearbox (build stand end).
- (3) Support the idler gear and remove the idler shaft from the gear and flanged roller bearings assembled to the gearbox case using the mechanical puller (Tool 741) (Ref.Fig.122).
 - (a) Disengage the nut from the thrust screw on the puller.
 - (b) Insert the thrust screw into the idler shaft from the front of the gearbox and locate the three keys, on the interior of the puller body, with the three cutaways in the idler shaft lip.
 - (c) Screw the nut on to the thrust screw protruding through the shaft.

- (d) Locate and engage the two captive bolts, in the puller anchor plate, with two of the front cover mounting bolt locations in the edge of the gearbox case.
- (e) Operate the thrust screw, ensuring the nut is located into the internal circumference of the idler shaft and withdraw the shaft, then release and remove the puller.
- (4) Remove the idler gear from the gearbox case.
- (5) Unscrew and remove the three self-locking nuts, flat washers and bolts securing the upper flanged roller bearing to the gearbox case, then remove the bearing from the case.
- (6) Unscrew and remove the three self-locking nuts, flat washers and bolts securing the lower flanged roller bearing to the gearbox case, then remove the bearing from the case.
- (7) Remove the self-locking nut securing the oil pump drive spur gear into its location in the gearbox case using the immobilizer (Tool 652) and wrench (Tool 651) (Ref.Fig.123).
- (a) Locate the lugs on the immobilizer sleeve with the corresponding castellations on the nut and the two captive bolts in the immobilizer plate with two of the front cover mounting bolt locations in the edge of the gearbox case.
- (b) Engage the splines on the wrench with the corresponding splines on the internal circumference of the spur gear, turn the wrench in a clockwise direction in order to unscrew the nut held by the immobilizer.
- (c) Remove the wrench then unscrew the captive bolts and remove the immobilizer and self-locking nut.
- (8) Remove the oil pump drive spur gear, two inner bearing rings and the spacer sleeve from their location in the gearbox case.
- (9) On engines Pre-SB.72-4 unscrew and remove the three self-locking nuts and bolts securing both flanged outer bearing rings to the gearbox case, then remove the bearing rings.

- (10) On engines embodying SB.72-4 unscrew and remove the three self-locking nuts and bolts securing the flanged bearing common outer ring. Remove the outer ring and plate washer.
 - (11) Remove the inner rings of both roller bearings and the spacer sleeve from the oil pump drive spur gear using the mechanical puller (Tool 739) (Ref.Fig.124).
 - (a) Secure the vice holder on the puller (Tool 739) in a bench vice.
 - (b) Position the spur gear and its assembled items into the puller so that the three claws on the puller locate under the inner ring of the bearing and into the three cutaways in the raised lip on the spur gear wheel.
 - (c) Lock the claws into their locations by tightening the puller adjusting nut.
 - (d) Operate the puller thrust screw ensuring the pad is located into the internal circumference of the shaft and extract the two bearing inner rings and the spacer sleeve from the spur gear.
 - (e) Unlock the three claws and remove the mechanical puller.
- S. Remove the Remaining Bearings, Strainers, Jets and the Cover from the Gearbox Case.
- (1) Release the 12 retainings rings retaining the 12 'D' headed bolts to the gearbox case at the location of the IDG gear shaft support bearing mounting face as viewed from the IDG mounting location.
 - (2) Remove the 12 bolts retaining the flanged ball bearing to the gearbox case, then remove the bearing.
 - (3) Unscrew and remove the four bolts securing the flanged outer ring of the bearing to the gearbox case at the rear of the main hydraulic pump adapter mounting face, then remove the outer ring.
 - (4) Unscrew and remove the three bolts securing the three segment assemblies to their locations on the interior of the gearbox case at the inclined bevel gear drive bearing housing mounting face, then remove the three segment assemblies from the six stepped pins.

- (5) Unscrew and remove the five bolts securing the cover to its location on the exterior of the gearbox case, then remove the cover and gasket.
- (6) Using the retainer (Tool 493) to retain the strainer housing, unscrew and remove the strainer body, strainer and strainer sleeve from the strainer housing at its location in the interior of the gearbox case at the base of the vertical bevel gear drive assembly location, refer to Fig.117.
 - (a) Align the flat on the retainer with the projection on the gearbox case and the lugs with the castellations on the strainer housing.
 - (b) Secure the retainer to the gearbox case with the three captive bolts.
 - (c) Unscrew and remove the strainer body from the strainer housing.
 - (d) Release and remove the retainer from the gearbox.
- (7) Separate the strainer and sleeve from the strainer body and separate the strainer from the sleeve.
- (8) Remove the strainer housing from the gearbox case using the puller (Tool 742).
 - (a) Using the shorter threaded end, locate and secure the puller screw into the strainer housing.
 - (b) Engage the puller screw into the puller, operate the thrust screw and withdraw the housing from the case.
 - (c) Remove the puller from the case and the housing from the puller.
- (9) Unscrew and remove the two bolts securing the oil jet assembly to its location in the interior of the gearbox case, then remove the oil jet from the case.
- (10) Engage the adapter (Tool 765) into the hollow pin located in the gearbox case at the stand-by hydraulic pump adapter mounting face. Engage the impact puller (Tool 1701) into the adapter and extract the hollow pin. Release and remove the puller and adapter.

OVERHAUL

- (11) Engage the adapter (Tool 779) into the jet (Pre SB.72-83) or extension (SB.72-83) assembled to the strainer assembly in its location in the stand-by hydraulic pump mounting face. Engage the impact puller (Tool 1701) into the adapter and withdraw the strainer assembly from the gearbox case. Release and remove the puller and adapter. On engines to Pre SB.72-83 remove the jet from each end of the strainer, or on engines to SB.72-83 remove the strainer extension.

T. Remove the Stepped Pins, Hollow Pins and Jet from the Gearbox Case.

NOTE: Removal of these items may only be necessary if required by inspection dept.

- (1) Remove the six stepped pins from their location in the rear of the inclined bevel gear drive bearing housing mounting face.
 - (a) Locate the thrust pin on the mechanical driver (Tool 777) into the stepped pin and the foot on the drivers clamp around the head of the pin.
 - (b) Screw in the thrust screw and withdraw the pin, release and remove the driver and carry out the same procedure for the remaining five pins.
- (2) Engage the adapter (Tool 780) into the front sleeve (Pre SB.72-83) or jet (SB.72-83) in its location in the rear of the main hydraulic pump mounting face. Engage the impact puller (Tool 1701) into the adapter and withdraw the sleeve or jet from the gearbox case. Release and remove the puller and adapter.
- (3) On engines Pre-SB.72-24 engage the adapter (Tool 734) into the hollow pin in its location in the front cover mounting face. On engines embodying SB.72-24 use the adapter (Tool 1869). Engage the impact puller (Tool 1701) in the adapter and withdraw the hollow pin from the gearbox case. Release and remove the puller and adapter.
- (4) On engines Pre-SB.72-24 engage the adapter (Tool 765) into the hollow pin in its location in the front cover mounting face. On engines embodying SB.72-24 use the adapter (Tool 1870). Engage the impact puller (Tool 1701) and withdraw the pin. Release and remove the puller and the adapter.

OVERHAUL

- (5) On engines Pre-SB.72-24 engage the adapter (Tool 768) into the hollow pin located in the front cover mounting face. On engines embodying SB.72-24 use the adapter (Tool 767). Engage the impact puller (Tool 1701) in the adapter and extract the pin. Remove the adapter and puller.

U. Prepare the Gearbox for Removal from the Build Stand.

- (1) Assemble the protectors to the gearbox case as listed in Table 102 (Ref.Fig.125).

Protector	Location on the Gearbox Case
Tool 770	Inclined bevel gear drive bearing housing mounting face
Tool 1878	Main hydraulic pump adapter mounting face
Tool 3078	Stand-by hydraulic pump adapter assembly mounting face
Tool 3079	Front cover mounting face
Tool 3075	Small cover
Tool 776	Pressure filter
Tool 776	Scavenge filter

Assembly of Protectors to the Gearbox Case
Table 102

V. Position the Gearbox into a Pallet.

- (1) Assemble lifting adapter (Tool 794) to the gearbox case close to the main and stand-by hydraulic pump mounting locations. Secure the adapter to the gearbox case with the two captive bolts refer to Fig.102.
- (2) Assemble the lifting adapter (Tool 793) to the gearbox case close to the inclined bevel gear drive assembly location. Secure the adapter to the gearbox with the two captive bolts.
- (3) Assemble the lifting fixture (Tool 827) to the centre of the top slot in the lifting fixture (Tool 795), secure the two fixtures together with the captive bolt, washer and nut.

OVERHAUL

- (4) Using a suitable lifting mechanism, position the fixture to the gearbox case, ensuring that the lifting plate (part of the fixture Tool 795), with the locking pin and fulcrum pin is next to the adapter (Tool 793).
- (5) Locate and tighten the fulcrum pin and locking pin on the lifting fixture to the adapter (Tool 793).
- (6) Locate and tighten the fulcrum pin on the lifting fixture to the adapter (Tool 794).
- (7) Operate the lifting mechanism so as to take-up the weight of the gearbox case, Unscrew the 32 captive bolts securing the gearbox case to the build stand (Tool 494). Remove the gearbox from the build stand.
- (8) Unscrew the locking pin on the lifting fixture and rotate the gearbox through approximately 90 deg, so access can be gained to the IDG mounting face on the gearbox case. Re-engage the locking pin.
- (9) Position the gearbox on a pallet then release and remove the lifting fixture.
- (10) Release and remove the two adapters from the gearbox case.
- (11) Position the protector (Tool 3076) to the IDG mounting face on the gearbox case.
- (12) Ensure all the disassembled items of the gearbox are identified and despatch all the items for cleaning.

OVERHAUL

MAIN OIL PUMP - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-00, Disassembly, for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.

2. Prepare the Oil Pump for Disassembly

- A. Assemble the Oil Pump to the Holding Fixture.
- (1) Ensure that the protector (Tool 869) is assembled to the oil pump/gearbox mounting face.
 - (2) Assemble the holding fixture (Tool 852) to a Hydraclamp, then assemble the oil pump to the holding fixture and secure it with four slave nuts and washers (Ref.Fig.101).
- B. Assemble the Protectors to the Oil Pump.
- (1) Release and remove the eight bolts securing the cover to the flange on the side of the pressure pump case, then remove the cover, bracket and gasket.
 - (2) Assemble the protectors (as necessary) to the pump flange faces (Ref.Fig.102 and Table 101).

3. Disassemble the Oil Pump

NOTE: For identification of the items/components of the oil pump refer to Fig.103.

CAUTION: ON PARTS TO SB OL.593-72-9036-419 STANDARD, IT MAY BE NECESSARY (DUE TO THE POSSIBLE ADHERENCE OF THE "O" RING TO THE JOURNAL) TO USE CONVENTIONAL HAND TOOLS TO AID THE REMOVAL OF THE MCD BODY ASSEMBLY, AS PART OF THE FILTER REMOVAL SEQUENCE. DURING THIS OPERATION IS IS ESSENTIAL THAT EXTREME CARE IS TAKEN, SO AS TO NOT DAMAGE ANY PART OF THE ASSEMBLY.

- A. Remove and Dismantle the Scavenge Filters
(Pre S.B.OL.593-72-9036-419) (Ref. Fig.104)
(S.B.OL.593-72-9036-419) (Ref. Fig.105).

- (1) Place a drip tray under the oil pump, then turn the Hydraclamp to a vertical position.
- (2) Loosen the three magnetic plugs, then using the serrated spanner (Tool 1478), unscrew the retaining rings which secure the three scavenge filters.
- (3) Withdraw the filters and remove the magnetic plugs, then unscrew and remove the filter bodies from the strainer units.
- (4) Withdraw the inner strainers from the outer strainers, then remove the springs from the inner strainers.

- B. Remove and Dismantle the Pressure Filter
(Pre S.B.OL.593-72-9036-419) (Ref. Fig.104).

- (1) Unscrew and remove the magnetic plug and its seal from the pressure filter cover (pre-SB.72-49) or filter retainer (SB.72-49).
- (2) Using the serrated spanner (Tool 1478) unscrew and remove the filter retaining ring then withdraw the filter assembly.
- (3) On pumps pre-SB.72-49 detach, by unscrewing, the strainer from the cover.
- (4) On pumps to SB.72-49 detach, by unscrewing, the outer element from the retainer. From the outer element recess unscrew and remove the self-locking nut to detach the inner element.

C. Remove and Dismantle the Pressure Filter
(S.B.OL.593-72-9036-419) (Ref.Fig.105).

- (1) Using the serrated spanner (Tool 1478) unscrew and remove the filter retaining ring then withdraw the filter assembly.
- (2) Detach, by unscrewing, the outer element from the retainer. From the outer element recess unscrew and remove the self-locking nut to detach the inner element.

D. Dismantle the Relief Valve (Ref.Fig.106).

- (1) Turn the oil pump to a horizontal position then release and remove the cap from the relief valve using the crowfoot wrench (Tool 1579 pre-SB.72-8 or Tool 1972, SB.72-8).
- (2) Release and remove the locknut from the adjuster, then install the torque adaptor assembly (Tool 3155) on to the retainer sleeve so that it engages the slots in the sleeve. Unscrew and remove the sleeve from the case, then remove the torque adaptor assembly (Tool 3155) from the sleeve.
- (3) Withdraw the spring from the case, then unscrew and remove the adjuster from the sleeve using the adjuster tool (Tool 1593).
- (4) Withdraw the valve from the valve guide in the case, then insert the puller locator (Tool 333) and push in the rod to locate the claws in the valve guide (Ref.Fig.107). Screw the puller (Tool 129) over the locator to extract the valve guide.
- (5) Unscrew the puller from the locator, then pull back the rod to release the valve guide.

E. Release the Pump Cases.

- (1) Release and remove the oil pump retaining bolts in the sequence shown (Ref.Fig.108), then remove the load spreading washers.
- (2) Remove the check valve cover, then detach the valve, spring and adjusting washer (if present).
- (3) Remove the cover from the sediment strainer.

SNECMA

F. Disassemble No.4 Scavenge Pump.

- (1) Screw three mechanical pullers (Tool 1021) through the threaded extraction holes in No.4 scavenge pump case to lift the case away from No.5 scavenge pump case, then remove the pullers from the case.
- (2) Remove the gears and the quillshaft, then tap out the sediment strainer from the inside of No.4 scavenge pump case using the driver (Tool 1479).
- (3) Assemble the holder (Tool 132) to a vice, then insert the sediment strainer unit into the holder so that the slots in the strainer locate over the pin in the holder. Unscrew the jet using tommy bar (Tool 1969) and withdraw the sleeve from the strainer.
- (4) Assemble the protector (Tool 119) to No.4 scavenge pump case.

G. Disassemble No.5 Scavenge Pump.

- (1) Screw the three mechanical pullers through the threaded holes in No.5 scavenge pump case to lift it away from No.2/3 scavenge pump case, then remove the pullers.
- (2) Remove the gears, then assemble the protector (Tool 126) to the case.

H. Disassemble No.2/3 Scavenge Pump.

- (1) Screw the three mechanical pullers through the threaded extraction holes in No.2/3 scavenge pump case to lift the case away from No.1 scavenge pump case, then remove the pullers.
- (2) Remove the gears, then assemble the protector (Tool 125) to the case.

I. Disassemble No.1 Scavenge Pump.

- (1) Screw the three mechanical pullers through the threaded extraction holes in No.1 scavenge pump case to lift it away from the CB scavenge pump case, then remove the pullers.
- (2) Remove the gears, then assemble the protector (Tool 127) to the case.

OVERHAUL

J. Disassemble the CB Scavenge and Pressure Pumps.

- (1) Screw the three mechanical pullers through the threaded extraction holes in the CB scavenge pump case to lift it away from the pins in the pressure pump case, then remove the pullers.
- (2) Push the headed pin out of its location in the CB scavenge pump case, then remove the scavenge and pressure pump gears from the pressure pump case. Assemble the protector (Tool 127) to the CB scavenge pump case.
- (3) Remove the pressure pump case from the holding fixture, then place all the scavenge pump cases into the container (Tool 1463) and the pressure pump case into the container (Tool 1471). Place the pump gears, etc. into the container (Tool 1470).

NOTE: The oil pump is now ready to be despatched for cleaning.

GENERAL (ENGINE ASSEMBLY) - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

STANDARD PRACTICES - FITS AND CLEARANCES

1. General

- A. Fits and clearances data is given in the form of tables and supporting illustrations. Each location where a fits and clearances check is required is assigned a Ref. No. to facilitate positive identification.
- B. Dimensional data in each table is specified under five headings, i.e. "Dimensions New", "Worn Dimensions (Non-Select)", "Reject if Over", "Clearance New" and "Permissible Worn Clearance". All dimensions are given in inches and millimeters.
- C. The "Dimensions New" column shows the drawing sizes to which components are manufactured. These dimensions are given as limits and represent the maximum and minimum acceptable sizes of the components when new.
- D. The "Worn Dimensions (Non-Select)" column shows the maximum wear allowable on a component which will still permit full interchangeability between components, i.e. selective assembly will not be required when mating components are both within the size limits shown in this column.
- E. Dimensions in the "Reject if Over" column are given only if all of the maximum allowable wear between components is not permitted to occur on the specified component. Where the column is left blank the maximum allowable wear, as shown by the difference between the "Clearance New" and "Permissible Worn Clearance" columns, may be borne by either component. If the dimension concerned refers to an external size, the "Reject if Over" heading shall be taken to mean "Reject if Under".
- F. At module break locations the "Reject if Over" dimension is controlled to make full interchangeability mandatory. These locations are identified in the "Remarks" column.
- G. The "Clearance New" column gives the maximum and minimum clearances when new components are assembled together. These clearances are functions of the maximum and minimum sizes of the components given in the "Dimensions New" column, i.e. the maximum clearance will be obtained with a minimum sized shaft installed in a maximum sized bush, conversely, the minimum clearance will be obtained with a maximum sized shaft installed in a minimum sized bush.

MK.610-14-28
OVERHAUL

- H. The "Permissible Worn Clearance" column shows the maximum working clearance allowed between any two components assembled together for a further period of service.

LP COMPRESSOR ASSEMBLY - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

LP COMPRESSOR DRIVE SHAFT - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

LP SHAFT SIGNAL GENERATING MECHANISM - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

COMPRESSOR INTERMEDIATE CASE ASSEMBLY - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

HP COMPRESSOR ASSEMBLY - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

HP COMPRESSOR DIFFUSER CASE ASSEMBLY - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

COMBUSTION SECTION - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

CONCORDE

OLYMPUS 539 OVERHAUL MANUAL

Temporary Revision No. 72-583
Insert in 72-40-00 before page 603

REASON FOR ISSUE:

Reissue of TR.72-546 to align with RR Revision 61

ACTION

Amend Fig and Ref No. 601-177 as follows:

CLEARANCE NEW		PERMISSIBLE WORN CLEARANCE		REMARKS
Ins.	mm.	Ins.	mm.	
0.1400	3,556	NOT APPLICABLE		Pre S.B.73-12 Ref: 72-40-00, Fig.601-177
0.216	5,486			
0.1400	3,556	NOT APPLICABLE		S.B.73-12.
0.250	6,350			

NOTE: These dimensions refer to the distance from the end of the nozzle to the combustion chamber inside surface.

HP TURBINE NOZZLES - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

LP TURBINE NOZZLES - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

LP TURBINE BEARING SUPPORT - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-Q9-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

TURBINE EXHAUST DIFFUSER ASSEMBLY - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

LEFT-HAND ACCESSORY GEARBOX ASSEMBLY - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

RIGHT-HAND ACCESSORY GEARBOX ASSEMBLY - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

MAIN OIL PUMP - FITS AND CLEARANCES

1. General

- A. Prior to using the Fits and Clearances (FCS) refer to 72-09-00 Fits and Clearances for general information on the content and use of the following Table.
- B. The Table extends onto facing pages and each column provides two sets of figures, the first in inches and decimals of inches and the second in millimeters and decimals of millimeters.
- C. Where a dimensional check is required between two items in the Inspection/Check and only one of the items is contained in this breakdown, a cross-reference to the breakdown number of its mating part is given in the remarks column.
- D. When a dimensional or backlash check is required between two items that cannot be carried out during the Inspection/Check, but must be checked during or after the assembly of the sub-assembly, an ** is given in the first column against the item concerned.

SPECIAL INCIDENTS - INSPECTION/CHECK

1. General

- A. This section contains appendices relating to essential inspection requirements following specific incidents in service.

The purpose of the appendices is to assist the overhaul base in defining work programmes for engines returned to overhaul base for investigation, repair and/or refurbishment.

- B. The appendices refer to essential inspection requirements.

In addition to essential inspection requirement, all parts exposed during the essential inspection procedure are to be inspected in accordance with the relevant inspection/check procedures, acceptance limits and fits and clearances detailed in the Overhaul Manual.

APPENDIX S1

INSPECTION FOLLOWING HP TURBINE BLADE FAILURE

1. General

This appendix details the essential inspection procedures to be applied following failure of HP turbine blades in service.

The essential inspection requirements of this appendix relate to a primary failure of the HP turbine but would also apply supplemented by further inspection, to a secondary failure resulting from failures in other areas of the engine.

All items and locations are to be inspected in accordance with the relevant inspection/check procedures, acceptance limits and fits and clearances detailed in the Overhaul Manual.

2. Engine Internal Examination

A. Inspect LP Compressor.

- (1) Inspect LP compressor case for evidence of stage 1 rotor blade tip rubbing. Reject if tip rub is evident at more than two positions around the case circumference (Ref. para.5, additional checks).
- (2) Inspect stage 1 rotor blades and vanes for damage (Ref. 72-09-03, Inspection/Check).
- (3) Inspect stages 2 to 7 rotor blades for damage (Ref. 72-09-03, Inspection/Check).

B. Inspect HP Compressor.

- (1) Inspect HP compressor rotor blades for damage (Ref. 72-09-03, Inspection/Check).

3. Essential Inspection Requirement

A. Inspect Turbine Exhaust Diffuser (Ref. 72-53-00, Inspection/Check).

- (1) Visually inspect exhaust diffuser inner and outer case for impact damage, cracking, distortion, scoring, fretting and local overheating.
- (2) Examine the turbine exhaust diffuser inner assembly for evidence of cracking around the vane ends.

- (3) Inspect LP turbine bearing and bearing housing
(Ref. 72-52-03, Inspection/Check).
- (a) Disassemble bearing outer race (Ref.72-52-03, Disassembly).
 - (b) Carry out crack detection procedure and inspection of bearing outer race.
 - (c) Carry out visual inspection of bearing housing.
 - (d) Inspect labyrinth seals as detailed in paragraph L.
- B. Inspect LP Turbine Rotor (Ref. 72-52-02, Inspection/Check).
- (1) Visually inspect turbine blades, disk and hub for impact damage, cracking, distortion, scoring, fretting and local overheating.
 - (2) Disassemble LP turbine rotor (Ref. 72-52-02, Disassembly).
 - (3) Inspect LP turbine rotor disk.
 - (a) Carry out crack detection procedure on disk.
 - (b) Carry out detail inspection of disk.
 - (c) If overheating of the disk is evident or suspected, carry out hardness check.
 - (4) Carry out crack detection procedure and inspection of turbine blades.
 - (5) Inspect LP turbine rotor hub and labyrinth assemblies.
 - (a) Carry out crack detection procedure on hub.
 - (b) Carry out detail inspection of hub.
 - (c) Carry out crack detection procedure and inspection of externally relieved bolts (72-52-02/1-120).
 - (d) Carry out crack detection procedure and inspection of bearing inner track.
 - (e) Inspect labyrinth seals as detailed in paragraph L.

- C. Inspect LP Turbine Nozzle (Ref. 72-52-01, Inspection/Check).
- (1) Visually inspect the turbine nozzle for impact damage, cracking, distortion, scoring, fretting and local overheating in the following regions.
 - (a) Nozzle vanes.
 - (b) Nozzle vane support diaphragm.
 - (2) Disassemble LP turbine nozzle (Ref. 72-52-01, Disassembly).
 - (3) Carry out crack detection procedure and inspection of nozzle vanes.
 - (4) Inspect labyrinth seals as detailed in paragraph L.
- D. Inspect HP Turbine Rotor (Ref. 72-51-03, Inspection/Check).
- (1) Visually inspect turbine blades, disk and hub for impact damage, cracking, distortion, scoring, fretting and local overheating,
 - (2) Disassemble HP turbine rotor (Ref. 72-51-03, Disassembly).
 - (3) Inspect HP turbine rotor disk.
 - (a) Carry out crack detection procedure on disk.
 - (b) Carry out detail inspection of disk.
 - (c) If overheating of the disk is evident or suspected, carry out hardness check.
 - (4) Carry out crack detection procedure and inspection of turbine blades.
- E. Inspect HP Turbine Rotor Hub and Labyrinth Assemblies (Ref. 72-51-04, Inspection/Check).
- (a) Carry out crack detection procedure on hub.
 - (b) Carry out detail inspection of hub.
 - (c) Carry out crack detection procedure and inspection of externally relieved bolts (72-51-04/1-180).

(d) Inspect labyrinth seals as detailed in paragraph L.

F. Inspect HP Turbine Nozzle (Ref. 72-42-01, 72-51-02, Inspection/Check).

(1) Visually inspect the turbine nozzle for impact damage, cracking, distortion, scoring, fretting and local overheating in the following regions.

(a) Nozzle vanes.

(b) Nozzle vane support cone.

(c) Nozzle vane abutment segments.

(d) Nozzle vane locking pins and location bolts.

(2) Disassemble HP turbine nozzle and combustion chamber assembly (Ref. 72-00-51).

(3) Carry out crack detection procedure and inspection of nozzle vanes.

(4) Carry out a detail inspection of the nozzle vane support cone for possible distortion (Ref. Fig.301).

(a) Check the locating diameter for roundness within the acceptable limits shown.

(b) Check the sloping face is true to the locating diameter within the acceptable angular limits shown.

NOTE: Should the limits shown be exceeded at checking positions where local fretting has occurred, the check is acceptable provided that the fretting is within the acceptable limit.

(5) Inspect labyrinth seals as detailed in paragraph L.

G. Inspect Combustion Chamber (Ref. 72-41-01, Inspection/Check).

(1) Visually inspect for impact damage, cracking, distortion, scoring, fretting and local overheating.

- H. Inspect HP Turbine Bearing Support and HP Turbine Bearing (Ref. 72-51-01, Inspection/Check).
- (1) Visually inspect the HP turbine bearing support rear face for impact damage, cracking, distortion, scoring and local overheating. Pay particular attention to the area around the bearing housing retaining bolt locations.
 - (2) Check the tightness of HP turbine bearing housing retaining nuts and bolts.
 - (a) Apply a tightening torque of 70 lbf in. (7,9 Nm) to each of the eighteen bolts. Movement of the bolt indicates looseness. It will not be possible to tighten any loose nut and bolt without first removing the combustion chamber outer case and the HP compressor diffuser case (Ref. 72-00-00, 72-00-51, Disassembly).
 - (3) Disassemble HP turbine bearing outer race (Ref. 72-00-51, Disassembly).
 - (4) Inspect HP turbine bearing outer race.
 - (a) Carry out crack detection procedure and inspection of bearing outer race (Ref. 72-33-00, Inspection/Check).
- J. Inspect Combustion Chamber Outer Case (Ref. 72-42-01, Inspection/Check).
- (1) Visually inspect combustion chamber outer case for impact damage, cracking, distortion, scoring, fretting and local overheating.
- K. Inspect HP Compressor Diffuser Case (Ref. 72-34-00, Inspection/Check).
- (1) Visually inspect outer skin of the diffuser case for evidence of cracking, particularly around the leading edge of the vane ends.
- L. Inspect Labyrinth Seals (Ref. Fig.302).
- (1) Inspect labyrinths 16 to 30.
 - (a) Measure and record all labyrinth seal fin diameters and bores.

NOTE: Some of the labyrinth rotating parts, particularly the fins of the 24/26 labyrinth, may be worn eccentrically. Heavier wear would be evident on the side corresponding to the light side of the rotor, the side where the blades failed.

- (2) Carry out crack detection procedures on all labyrinth rotating parts and housings that show evidence of rubbing.
- (3) Inspect bore of No.26 rotating labyrinth seal fin carrier for evidence of rubbing contact with the LP compressor driveshaft.

OVERHAULAPPENDIX S2CLEANING OF OIL SYSTEM FOLLOWING ENGINE BEARING OR
GEARBOX FAILURE1. General

This appendix details the disassembly and cleaning procedures to be applied when failure of an engine bearing or gearbox has resulted in contamination of the engine oil system.

Although this appendix relates to disassembly and cleaning procedures, reference is made to inspection/check and the appendix is therefore included in this section for information.

On receipt of contaminated sub-assemblies/modules, carry out the disassembly and cleaning procedures required depending on the extent of contamination found on magnetic plugs and filters.

Visually inspect all exposed items and interface surfaces to the requirements of the relevant Inspection/Check chapter.

NOTE: Sub-assemblies/modules disassembled for investigation into the source of contamination should be inspected in accordance with the relevant Inspection/Check chapter of the Overhaul Manual.

When disassembly of the engine main bearing compartments is necessary, only disassemble to the extent required to remove all contaminated items.

2. Disassembly and Cleaning Requirement When Any Magnetic Plug or Filter is Abnormally Contaminated

A. Oil Tank.

- (1) Disassemble the oil tank (Ref. 79-11-01, Disassembly).
- (2) Clean the oil tank (Ref. 79-11-01, Cleaning).

B. Oil Cooler.

- (1) Clean the oil cooler in accordance with the vendor's overhaul manual.

INSPECTION/CHECK

72-00-00

Appendix S2

C. Filters and Magnetic Plugs.

(1) Master magnetic plug

- (a) Retain sample of debris if plug is abnormally contaminated.
- (b) Clean the master magnetic plug (Ref. 79-23-01, Cleaning).

(2) Left-hand gearbox

- (a) Retain sample of debris from any abnormally contaminated filter and/or magnetic plug for investigation into source of contamination. Identify the location from which the sample was taken.
- (b) Clean filters and magnetic plugs (Ref.72-65-00, Cleaning).

(3) Right-hand gearbox

- (a) Retain sample of debris if magnetic plug and/or filter is abnormally contaminated.
- (b) Clean magnetic plug and filter (Ref.72-63-01, Cleaning).

(4) LP compressor front bearing scavenge filter

- (a) Retain sample of debris if filter is abnormally contaminated.
- (b) Clean the filter (Ref. 72-01-01, Cleaning).

D. Sub-assemblies/Modules.

- (1) Disassemble and clean sub-assemblies/modules to the requirements of paragraphs 3, 4, 5 and 6.

3. Disassembly and Cleaning Requirement When Magnetic Plug and/or Filter Checks Indicate Abnormal Contamination in Left-Hand Gearbox

A. Left-hand gearbox Sub-Assembly/Module.

- (1) Disassemble the left-hand gearbox (Ref. 72-62-00, Disassembly).

APPENDIX S3INSPECTION OF ENGINE FOLLOWING AN N1 OVERSPEED1. General

This appendix details the essential inspection procedures to be carried out following:

- (a) an N1 overspeed at or above 120%
- (b) LP compressor blade tip rub at stages 1 and/or 4 as a result of N1 overspeed between 108.5 and 120%.
- (c) N1 overspeed between normal maximum limit and 108.5% for a period in excess of 20 seconds.

2. Remove Modules for Inspection/Check Purposes

- A. Disassemble engine to sub-assemblies (Ref.71-00-01, 72-00-00, Disassembly).

3. Essential Inspection Requirement

A. Inspect the LP Compressor

- (1) Disassemble the LP compressor (Ref. 72-31-00, 72-31-01, 72-31-02, 72-31-03, Disassembly).
- (2) Inspect the LP compressor
 - (a) Inspect all compressor blades for cracks and tip rubbing (Ref. 72-31-02, Inspection/Check).
 - (b) Inspect all compressor disks for cracks (Ref. 72-31-02, Inspection/Check).
 - (c) Inspect all compressor vanes for cracks (Ref. 72-31-01, 72-31-03, Inspection/Check).

B. Inspect the LP Turbine Rotor

- (1) Disassemble the LP turbine rotor (Ref. 72-52-02, Disassembly).
- (2) Inspect the LP turbine rotor (Ref. 72-52-02, Inspection/Check).
 - (a) Inspect rotor disk for cracks.

APPENDIX S4INSPECTION OF ENGINE FOLLOWING AN N2 OVERSPEED1. General

This appendix details the essential inspection procedures to be carried out following an N2 overspeed.

2. Remove Modules for Inspection/Check Purposes

A. Disassemble engine to sub-assemblies (Ref. 71-00-01, 72-00-00, Disassembly).

3. Essential Inspection Requirement

A. Inspect the LP Compressor

(1) Disassemble the LP compressor (Ref. 72-31-00, 72-31-01, 72-31-02, 72-31-03, Disassembly).

(2) Inspect the LP compressor (Ref. 72-31-01, 72-31-02, 72-31-03, Inspection/Check).

(a) Inspect all compressor blades for cracks and evidence of tip rubbing.

(b) Inspect all compressor disks for cracks

(c) Inspect all compressor vanes for cracks

B. Inspect the HP Compressor

(1) Disassemble the HP compressor (Ref. 72-33-00, 72-33-01, 72-33-02, Disassembly).

(2) Inspect the HP compressor (Ref. 72-33-02, Inspection/Check).

(a) Inspect all compressor blades for cracks.

(b) Inspect all compressor disks.

(i) Carry out crack detection procedure.

(ii) Carry out dimensional check of spigot location diameters (Ref. 72-33-00, Fits and Clearances).

APPENDIX S6

INSPECTION OF TURBINES FOLLOWING BLOCKAGE/
OBSTRUCTION BY DEBRIS1. General

This appendix details the essential inspection procedures and actions to be carried out following blockage/obstruction of the HP turbine nozzle by debris.

In-service inspection and acceptance standards for blockage/obstruction of the HP turbine nozzle are detailed in Appendix 6 of the Heavy Maintenance Manual and are repeated here for information. Refer paragraph 2.

2. Inspection of Turbine Modules

A. Establish the Blockage Number (B.No.).

- (1) When debris obstructs the gas flow passages of the nozzle annulus, estimate and record the following data.
 - (a) The total, forward facing, area of the blockage/s.
 - (b) The maximum height (h) of the blockage. Measure the blockage radially, in line with the adjacent vanes, from the inner to the outer edge.
 - (c) Take the annulus height (H) as 4.2 in. and calculate h/H.
- (2) Using the h/H value calculated, apply the estimated blockage area and determine the B.No. from the graph (Ref. Fig.301).
- (3) Inspect to the standards specified in paragraph B.

B. Inspection and Acceptance Standards.

CAUTION: BEFORE PROCEEDING TO DISASSEMBLE HP AND/OR LP TURBINE BLADES FROM DISKS AS RECOMMENDED IN TABLE 301, OBSERVE AND COMPLY WITH REQUIREMENT OF PARAGRAPH (2).

- (1) Refer to Table 301 and carry out the recommended Action relevant to the B.No. obtained.

OVERHAUL

- (2) Prior to disassembling HP and/or LP turbine rotor blades from disks, carry out the blade slackness checks specified in the Overhaul Manual 72-51-03 and 72-52-02, Disassembly. If any clearance exists at the centre section of the shroud interlocking joints, reject the blades irrespective of the B.No.

B.No.	Action
Up to 1.50	Continued engine operation is acceptable while the engine remains installed (Ref. Maintenance Manual 72-51-00 Inspection/Check). Blockage must be removed when engine is removed from aircraft.
1.51 to 2.00	Remove LP turbine rotor module and visually inspect blades. (Ref. 72-00-00, General, Inspection/Check). Accept if satisfactory.
2.01 to 2.50	Remove LP turbine rotor module and carry out full crack detection checks and inspection on LP turbine rotor blades (Ref. Overhaul Manual). Accept if satisfactory.
2.51 to 3.00	Reject LP turbine rotor blades. Install new rotor blades in accordance with Overhaul Manual procedures.
3.01 to 4.00	Reject LP turbine rotor blades. Visually inspect LP turbine disk (Ref. 72-00-00, General, Inspection/Check) and accept if satisfactory. Install new rotor blades in accordance with Overhaul Manual procedures.

APPENDIX S7INSPECTION OF THE HP TURBINE AND LP TURBINE BEARING
AND HOUSING FOR OIL COKING AND LACQUERING1. General

Carbon shedding has been responsible for several IFSD incidents, where blockage of the engine oil pressure filter with carbon deposits results in low oil pressure in flight.

Carbon shedding incidents are monitored and reviewed by Rolls-Royce with a view to making appropriate recommendations to prevent further IFSD's due to this problem. Data from long life (2000 hours plus) modules, and engines which have been involved in carbon shedding incidents, or where exceptional amounts of carbon are noted during engine strip, is of particular benefit.

This appendix relates to information requested by Rolls-Royce whenever an incident of carbon shedding arises, an exceptional amount of carbon is noted during engine strip, or a long life module (2000 hours plus) is available.

2. Inspect HP Turbine Bearing and Housing

NOTE: If heavy coking (i.e. rough carbon) is found during inspection of the bearing and housing, carry out additional checks in accordance with paragraph 4.

- A. Disassemble HP turbine bearing and housing (Ref. 72-33-00, 72-51-01, Disassembly).
- B. Inspect for, and record the amount of, coking/lacquering at the following locations (Ref. Fig.301).
 - (1) HP turbine bearing.
 - (2) No.16 labyrinth ring.
 - (3) Bore of the oil feed elbow.
 - (4) Bore of the oil scavenge elbow.
 - (5) Oil feed jets.
 - (6) Bore of the oil feed tube, at both connector positions.
 - (7) Bore of the oil scavenge tube, at both connector positions.

- C. Inspect and record condition of insulation blankets (Ref. Fig.301).

3. Inspect LP Turbine Bearing and Housing

NOTE: If heavy coking (i.e. rough carbon) is found during inspection of the bearing and housing, carry out additional checks in accordance with paragraph 4.

- A. Disassemble LP turbine bearing and housing (Ref. 72-52-03, Disassembly).
- B. Inspect for, and record the amount of, coking/lacquering at the following locations (Ref. Fig.302).
- (1) LP turbine bearing.
 - (2) Bearing retaining ring.
 - (3) LP turbine bearing housing.
 - (4) Rear cover assembly.
 - (5) Bore of oil feed tube in rear cover assembly.
 - (6) LP shaft signal generating mechanism.
 - (7) Oil feed jet.
 - (8) Bore of oil feed tube.
 - (9) Bore of oil scavenge tube.
- C. Inspect and record condition of insulation blankets (Ref. Fig.302).
- D. Inspect for signs of external oil leakage at LP signal system operating lever location in rear cover assembly and record findings (Ref. Fig.302).
- E. Inspect seal carriers removed from vane locations 2, 4 and 7 for wear (Ref. 72-52-03, Fits and Clearances, Fig.602, locations AA, AB and AE). Record amount of wear (Ref. Fig.302).
- F. Inspect cold vent tube outer spherical location for wear (Ref. 72-53-00/601-250, Fits and Clearances). Record the amount of wear (Ref. Fig.302).

4. Additional Inspection if Heavy Coking is Found

A. Measure and record dimensions at the following locations (Ref. Table 301).

- (1) Outer air duct in cover unit (Ref. 72-51-01/602-234, Fits and Clearances).
- (2) Duct assembly in elbow (Ref. 72-51-01/601-255, Fits and Clearances).
- (3) Labyrinths 13 to 22 (Ref. 72-51-01, 72-51-02, Fits and Clearances).
- (4) No.12 labyrinth (Ref. 72-33-00/601-127 to 601-132, Fits and Clearances).

B. Inspect HP diffuser case for wear in the bore of coupling assembly locations at vanes 3, 4 and 5 (Ref. 72-51-01, Fits and Clearances, Fig.601, locations AD, AE and AF). Measure and record the amount of fretting/wear caused by the piston rings (Ref. Table 301).

5. Service Bulletin Status

A. Record Service Bulletin embodiment status at time of inspection (Ref. Table 302).

APPENDIX S8

INSPECTION OF MAJOR COMPONENTS FOUND CRACKED
FOLLOWING ENGINE FAILURE IN SERVICE

1. Procedure

If, during routine inspection following a major in-service engine failure, a major component and/or attaching part(s) are found cracked, the relevant local Inspection Authority and the Olympus Project Office, Rolls-Royce plc should be contacted for advice regarding the need for additional inspections on related components.

Contact address: Olympus Project Office, WH61,
Rolls-Royce plc,
P.O. Box 3,
Filton,
Bristol,
England

Contact Olympus Project Office or the local Rolls-Royce plc Representative for confirmation of despatch address for parts returned to Rolls-Royce plc for defect investigation.

APPENDIX S9INSPECTION OF AIR DRIVEN ACCESSORIES/AIR
CONTROL SYSTEMS FOLLOWING ENGINE FAILURE1. General.

- A. This appendix details the Disassembly, Cleaning and Inspection/Check procedures to be applied when engine failure has resulted in contamination of the external air system.

2. Disassembly, Cleaning and Inspection/Check Requirement when
Engine Failure has led to LP and HP Compressor Damage.

A. Second Stage Pump.

- (1) Disassemble the Second Stage Pump as per vendors Overhaul Manual (Ref.73-11-02, Disassembly).
- (2) Clean the Second Stage Pump as per vendors Overhaul Manual (Ref.73-11-02, Cleaning).
- (3) Carry out Inspection/Check of Second Stage Pump as per vendors Overhaul Manual (Ref.73-11-02, Inspection/Check).

B. Fuel Heater.

- (1) Disassemble the Fuel Heater as per vendors Overhaul Manual (Ref.73-10-03, Disassembly).
- (2) Clean the Fuel Heater as per vendors Overhaul Manual (Ref.73-10-02, Cleaning).
- (3) Carry out Inspection/Check of the Fuel Heater as per vendors Overhaul Manual (Ref.73-10-03, Inspection/Check).

C. Fuel Heater Valve.

- (1) Disassemble the Fuel Heater Valve as per vendors Overhaul Manual (Ref.73-10-03, Disassembly).
- (2) Clean the Fuel Heater Valve as per vendors Overhaul Manual (Ref.73-10-03, Cleaning).
- (3) Carry out Inspection/Check of the Fuel Heater Valve as per vendors Overhaul Manual (Ref.73-10-03, Inspection/Check).

APPENDIX S10

INSPECTION OF ENGINE FOLLOWING INTERNAL
CONTAMINATION BY DRY POWDER FIRE EXTINGUISHANT

1. General.

- A. This appendix details the essential procedures to be applied following internal contamination by Dry Powder fire extinguishant.
- B. Although this appendix relates to disassembly and cleaning procedures, reference is made to inspection/check and the appendix is therefore included in this section for information.
- C. Contamination by this substance into a running or hot engine can lead to the following:
 - (1) Fused/glacéous deposits, this could be apparent in the hotter combustor/turbine regions.
 - (2) Material attack of light alloys/steels etc. if the residue powder is allowed to become wet.
 - (3) Physical blockage/contamination due to powder entrapment.
 - (4) Oil system sludging/blockage due to fine powder contamination.

2. Remove Modules and Air Driven Accessories/Air Control Systems for Disassembly, Cleaning and Inspection/Check Purposes

- A. Strip, clean and inspect/check all modules in accordance with the existing procedures.
- B. Strip, clean and inspect/check oil system in accordance with the existing procedures.

OLYMPUS 593

MK.610-14-28
OVERHAUL

sneema

C. Strip, clean and inspect the following in accordance with the existing procedures in the relevant Venders Overhaul Manual.

- (1) Second Stage Pump.
- (2) Fuel Heater.
- (3) Fuel Heater Valve.
- (4) Anti-Icing Valve.

ENGINE LUBRICATION SYSTEM - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

- (c) Not more than 0.005 in.
(0,130 mm) deep, regardless
of extent.

Accept, if sealing
capability is
unimpaired after
repair.

(4) Wear and fretting.

- (a) Contact faces worn;
sealing capability
unimpaired.

Accept.

C. Inspect Jet Bores (302-10 only).

NOTE: This is a multi-jet unit.

CAUTION: DO NOT PROBE THE JET ORIFICES WITH HARD OBJECTS,
DAMAGE MAY RESULT AND GIVE INCORRECT FLOW.

- (1) Check for damage to jet bores and outlets, using
magnifier.

- (a) Any damage, other than
minor scratches in bores.

Accept, if flow
check satisfactory
after repair (Ref.
72-01-00 Testing).

- (b) No damage, other than
minor scratches in bores.

Accept.

- (2) Check for obstruction.

- (a) Obstructed.

Reject for cleaning
and investigation
(Ref.72-01-00
Testing).

5. Tube Assemblies (303-270, 304-70/80/240, 305-150/250,

6. Elbow (307-280), Flange Assembly (308-260) and Blanks (308-80, 309-50 and 310-100)

A. Inspect Abutment Faces.

(1) Scores.

- (a) Less than 0.010 in.
(0,250 mm) deep, and not
extending more than
half-way across face.

Accept if repair
preserves surface
flatness and
sealing capability
and is within 5 per
cent of flange
thickness.

(2) Nicks and burrs.

Accept, if repair
preserves surface
flatness and
sealing capability
and is within 5 per
cent of flange
thickness.

B. Inspect Bolt Locations.

(1) Wear and fretting.

- (a) Bolt-holes elongated
not more than 0.030 in.
(0,760 mm).

Accept after
repair.

7. Blanking Ferrule (302-40)

A. Inspect Spherical Face.

(1) Nicks, burrs and scores.

Accept, if repair
preserves sealing
capability.

B. Inspect Retaining Ring Location.

(1) Nicks and burrs.

Accept after
repair.

STANDARD PRACTICES - INSPECTION/CHECK

1. General

- A. Inspection comprises general inspection and special inspection checks. General inspection consists of visual examination of components for condition and dimensional checking of components for wear and/or distortion. Special inspection checks are detailed in the Chapter applicable to the assembly concerned.
- AA. If a component(s) that is being inspected has come from an engine/module which has suffered a major in service failure and is found to be cracked, report the findings to the local Inspection Authority or CESO Service Centre since additional inspection on related components may now be required. Similarly, if a major component or attaching part(s) are found to be cracked during normal overhaul, then the Inspection Authority or CESO Service Centre should be contacted for similar advice before proceeding.
- B. An Inspection Report shall be provided for each assembly. Each report shall provide for the following information to be recorded and countersigned where required:
- (1) All component identification and code numbers.
 - (2) All reconditioning requirements, including blending and polishing.
 - (3) The results of crack detection tests.
 - (4) Satisfactory completion of all dimensional checks.
 - (5) Satisfactory completion of all pressure tests.
 - (6) Embodiment of all mandatory modifications.
 - (7) All reconditioning has been effected within the repair limits given in the Chapter applicable to the assembly concerned.
 - (8) Satisfactory completion of general inspection.
- C. The Inspection Reports will therefore provide a complete history of the assemblies during overhaul.

CAUTION: TO ENSURE ADEQUATE INSPECTION OF GROUP A ROTATING COMPONENTS. IT IS IMPORTANT DURING THE OVERALL VISUAL EXAMINATION THAT SPECIAL ATTENTION IS ALSO PAID TO DEFINED CRITICAL AREAS. THE CRITICAL AREAS OF SPECIFIED COMPONENTS ARE IDENTIFIED IN THE RELEVANT CHAPTER.

- D. All components must be visually examined for general condition to ensure that they are satisfactory for a further engine or module life. Refer to Table 321 for inspection terminology used throughout the inspection/check procedures and the definition of all types of defects that may be encountered, and for which all components must be examined as appropriate.
- E. When the inspection of a component discloses a minor defect that requires rectification, it is defined throughout the inspection/check procedures as 'Accept after repair'. On all such occasions the component must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref. No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified.
- F. Components that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair. But to prevent the re-use of rejected components, they should be clearly identified by temporary markings (Ref.para.3.), distinctive colours being used to denote components which are to be scrapped, held for possible repair, and those which are to be modified or salvaged.
- G. When dimensionally checking the inside diameters of parts not requiring a run-out measurement, a reading shall be taken at four equi-spaced locations and the results averaged to determine the measurement.
- H. Oil holes and passageways shall be examined to ensure that they are clean and unobstructed.
- J. If an obstructed oil passageway is found, the component(s) fed by that oil supply shall be examined for evidence of oil starvation.

OLYMPUS 593

MK.610-14-28
OVERHAUL

sneema

- K. Blanking plugs and union nuts which are not required to be removed for overhaul shall be checked for security and locking.
- L. Shims shall be examined for distortion and damage.
- M. Flanges and similar flat abutment faces shall be checked for bedding using a 0.0015 in. (0,040 mm) feeler gauge.
- N. Serrations and splines shall be examined for fretting and oxidation and their fit in mating components shall be checked.
- P. Gear teeth shall be examined on the driving and driven flanks for witness marks of incorrect running alignment.

NOTE: The backlash of mating gears is checked during assembly.

- Q. Protect components against corrosion after each operation, and place in containers for protection against damage during transit between operations (Ref.72-09-20 Repair).

2. Crack Detection

A. General.

- (1) Two methods of checking for cracks are recommended for use during overhaul of the engine, magnetic particle examination and fluorescent penetrant examination.

CAUTION: TO ENSURE ADEQUATE INSPECTION OF GROUP A ROTATING COMPONENTS, IT IS IMPORTANT DURING THE OVERALL CRACK DETECTION EXAMINATION THAT SPECIAL ATTENTION IS ALSO PAID TO DEFINED CRITICAL AREAS. THE CRITICAL AREAS OF SPECIFIED COMPONENTS ARE IDENTIFIED IN THE RELEVANT CHAPTER.

- (2) The method applicable to individual components is detailed in the Chapter applicable to the assembly concerned, and is dependent upon the material and configuration of the component. Some components require both methods to be applied.

B. Magnetic Particle Examination.

- (1) It is assumed that the magnetic particle examination equipment in use is capable of accommodating each of the components to be examined and that the operator is fully conversant with its operation.

WARNING: WEAR P.V.C. GLOVES TO PROTECT HANDS FROM
DETECTOR FLUID. SKIN DISEASE MAY RESULT.

- (2) Components requiring magnetic particle examination are illustrated in their relevant Chapters in the form of diagrams showing the specific method and current values to be used. Interpretation of these diagrams is shown in Fig.301.
- (3) Each component is to be examined in accordance with Process MP1 (Ref.Table 302).

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (4) Different types of magnetic particle inspection equipment in use have various types of current output, the amperages read from the equipment may not be the same meter scaling as those specified in this manual. The amperages quoted in this manual are Peak Amps and the relevant conversion factors for the type of magnetising current in use is tabulated in tables 303 and 304.
- (5) All components must be degreased using Triklone N only.

SEQUENCE	OPERATION	REMARKS
1	Clean to relevant Chapter.	-
2	Demagnetize.	-
3	Degrease.	Until clean.
4*	Carry out first magnetization sequence shown on diagram.	Refer to diagram for full details.
5	Examine.	Visual, use X2½ to X10 magnification for detailed examination.
6	Demagnetize.	-
7*	Repeat sequence 4, 5 and 6 for each magnetizing sequence shown on diagram.	-
8	Check for demagnetization using a calibrated instrument. Value to be less than <u>±3</u> oersteds.	Use portable field indicator.
9	Clean and protect as necessary.	-
* <u>NOTE</u> : Magnetic ink to be applied simultaneously with magnetization by pouring, spraying or immersion.

C. Fluorescent and Dye Penetrant Examination

- (1) It is assumed that the fluorescent penetrant examination equipment in use is capable of accommodating each of the components to be examined and that the operator is fully conversant with its operation.

WARNING: WEAR P.V.C. GLOVES TO PROTECT HANDS FROM PENETRANT FLUIDS. SKIN DISEASE MAY RESULT.

- (2) Approved penetrant systems are detailed in Table 303. In the table groups F1 and F2 correspond to ascending order of sensitivity. In each group sensitivity is considered to be approximately equivalent.
- (3) Penetrants in Process F1A are water washable, whereas penetrants in Process F2A are post emulsified.

GROUP	PROCESS	PENETRANT	REMOVER	DEVELOPER
F1	F1A	Ardrox 970P4	Water	Ardrox 9D3
		Ardrox 970PO	Water	Ardrox 9D3
		Zyglo ZL16	Water	Zyglo ZP4
		Zyglo ZL17B	Water	Zyglo ZP4
		Turco WP100	Water	Fluorocheck
F2	F2A	Ardrox 985P1	Water/Ardrox 9PR4*/Water	Ardrox 9D3
		Zyglo ZL2A	Water/Zyglo ZR1*/Water	Zyglo ZP4
		Ardrox 985P1	Water/Ardrox 9PR6+/Water	Ardrox 9D3
	F2A ALTERNATIVE	Ardrox 985P3	Ardrox 9PR4/Water	Ardrox 9D3
S3	S3B	Ardrox 996	Trichloroethylene vapour and/or liquid	Ardrox 9D2

NOTE: * Five per cent solution in water.
+ Ten per cent solution in water.

C. Fluorescent Dye Penetrant Examination.

- (1) It is assumed that the fluorescent penetrant examination equipment in use is capable of accommodating each of the components to be examined and that the operator is fully conversant with its operation.

WARNING: WEAR P.V.C. GLOVES TO PROTECT HANDS FROM PENETRANT FLUIDS. SKIN DISEASE MAY RESULT IF THIS PRECAUTION IS NOT TAKEN.

- (2) Approved penetrant materials are detailed in Table 311. In the table processes F1A, F2A and F3A correspond to ascending order of sensitivity. In each process sensitivity is considered to be approximately equivalent.
- (3) Penetrants in Process F1A are water washable, whereas penetrants in Process F2A and F3A are post emulsified.
- (4) Materials from more than one manufacturer must not be used together.

- (5) Components requiring fluorescent or dye penetrant examination are tabulated in the relevant Chapter. The tables also detail the process applicable to each component and include an alternative where necessary.
- (6) Refer to Table 312 for Process F1A, Table 313 for Process F2A, Table 314 for Process F3A and to Table 315 for Process S3B.
- (7) All components must be degreased using Triklone N only.

SEQUENCE	OPERATION	TIME	REMARKS
1	Clean.	-	Refer to relevant component Cleaning Chapter.
2	Degrease.	-	Ref.72-09-00, Cleaning.
3	Cool to 40 deg C.	-	To allow components to be handled comfortably.
4	Apply penetrant to surfaces for examination by immersion, spray, brush or flow on techniques.	See sequence 5.	Fully cover designated surfaces.
5	Drain.	20 to 30 min includes sequence 4 time.	Surfaces must remain wetted. If max drain time is exceeded reprocess from sequence 2.

For Chief Technical and Industrial Services Engineer CAA Design Approval No.DAI/8566/78

TEMPORARY REVISION NO.72-561

Insert in 72-09-00 before page 321

REASON FOR ISSUE

Amendment to Table 213

ACTION

Process F2A - Table 213 delete sequence 4 and read the following:-

4. Apply penetrant to surfaces for examination, spray, brush or flow on techniques. Electrostatic equipment can be used for the application of Ardrex 985 Pl.

NOTE: Ensure sufficient penetrant is applied to give adequate soak into any crack that may exist.

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION No. 72-555

Insert in 72-09-00 before page 327

REASON FOR ISSUE:

BEOL amendment to marking of components

ACTION

Delete paragraphs D (1) and (2) and read the following:

- (1) Markings should be of rapid drying ink applied using felt point pencils. The use of 'VERITHIN' white pencil is an approved method of temporary marking on components.
- (2) When a temporary marking is no longer required it should be removed using a suitable solvent.

NOTE: One of the following agents must be used to remove the temporary markings when no longer required (a) Genklene (b) Methylated spirits (c) Cellulose thinners

3 July 1981

OLYMPUS 593

MK.610-14-28
OVERHAUL

3. Temporary Marking

- A. During overhaul it is necessary to apply temporary markings to components in order to monitor them through the overhaul procedure and to indicate defects, condition, etc.
- B. Two means of temporary marking are employed, attaching labels to the components and marking on the components.
- C. Attaching Labels.
 - (1) Labels and attaching wire used during disassembly and cleaning/stripping should be of metal resistant to the solutions involved; type 18/8 austenitic stainless steel is recommended.
 - (2) During inspection the metal labels should be replaced by cardboard labels of a colour denoting the component condition, e.g. green for acceptable components, yellow or orange for repairable components and red for rejected components.
- D. Marking on Components.

CAUTION: DO NOT USE LEAD PENCIL OR METALLIC PENCIL OR ANY MARKING MEDIUM THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER OR LEAD. THESE DEPOSITS MAY CAUSE CEMENTATION OR INTERGRANULAR ATTACK AT HIGH TEMPERATURE AND RESULT IN STRENGTH LOSS AND SUBSEQUENT FAILURE. IF SURFACES ARE ACCIDENTLY CONTAMINATED WITH THESE DEPOSITS, CAREFULLY REMOVE THE DEPOSIT USING A METHOD APPROPRIATE TO THE TYPE OF DEPOSIT AND THE COMPONENT MATERIAL.

- (1) Markings should be of rapid drying ink applied using felt point pencils.
- (2) When a temporary marking is no longer required it should be removed using a suitable solvent.

4. Ball and Roller Bearings

A. General

- (1) For the purpose of examination ball and roller bearings are categorized as Main Bearings, i.e. those supporting the LP and HP rotating assemblies, and Auxiliary Bearings, i.e. all other bearings.

CAUTION: UNLESS OTHERWISE STATED, DO NOT INTERMIX COMPONENTS OF BALL AND ROLLER BEARINGS. REJECT BEARINGS CONCERNED IF INTERMIXING OCCURS AND POSITIVE IDENTIFICATION CANNOT BE ESTABLISHED. FAILURE MAY RESULT.

INSPECTION/CHECK

72-09-00

Page 327

May 1/81

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (2) All work on bearings must be carried out in a 'CLEAN ROOM'.
- (3) It is assumed that the bearings are received for examination after disassembly in clean containers and protected with anti-corrosive lubricants.
- (4) Bearings should be inspected without removal of the oil film, but if necessary surplus oils can be removed with a lint free cloth.
- (5) During inspection bearings and their components should not be exposed outside their protective bags for periods longer than 10 hours.
- (6) If bearings and their individual components are not required for immediate examination they should be temporarily protected for a 14 day period by immersing in engine lubricating oil or light mineral oil D.E.R.D.2490 at a temperature of between 105 and 110 deg.C for a period of 5 min. duration. For periods exceeding 14 days and less than 3 months immerse the bearings in mineral jelly J.S.D. PX.7 or Shell S.4181 maintained at a temperature of between 105 and 120 deg.C rotating the bearings to ensure complete protection. Allow to cool and drain, then place in clean polythene or PVC bags to await examination.

B. Examine the Bearings.

- (1) Examine bearing components for discoloration due to overheating. Reject the complete bearing if evidence of overheating is found.
- (2) Visually examine bearing components in accordance with Table 316, using X2 magnification. If there is any doubt concerning the acceptance of a particular defect, re-examine using X5 magnification.

NOTE: A limited number of main bearing components may be changed for serviceable components (Ref.72-09-00 Repair). If bearing components are rejected and no substitution is permitted, the complete bearing shall be rejected.

C. Examine the Auxiliary Bearings.

CAUTION: BEARINGS INTRODUCED BY SERVICE BULLETIN
OL.593-72-8976-374 MUST NOT BE DISASSEMBLED.

- (1) For bearings which can be partially or completely disassembled to their component parts, examine the disassembled parts and apply the acceptance standards as specified in para.4.B.
- (2) For bearings or bearing sub-assemblies where further disassembly is not practicable without unrivetting cages, etc., visually examine as far as practicable for defects such as cracks, corrosion pitting, scores, scratches, indentations, etc. Reject the bearing if any defects are found.
- (3) Check for wear in accordance with the relevant Fits and Clearances Chapter. Reject the bearing if worn outside the specified limits.

D. Reprotect the Bearings.

- (1) If bearings are not to be installed in the engine immediately following inspection, reprotect them with the 14 day or extended (3 month) protective treatment (Ref. para. 4.A.).

BEOL NOTE added

ACTION

Read the following BEOL NOTE after paragraph 5A:-

BEOL NOTE: Self Locking Shaft Nuts

At first overhaul of all left and right hand gearboxes, and intermediate casing internal drives of engines up to and including CBE 065.

Inspect the self locking features of all self locking shaft nuts of the following part numbers:

U755062, U755065, U755068, U755069, U755070,
U755072 and U755074.

Reject all nuts with a four lobe locking feature (i.e. end threads deformed squarely).

All elliptically deformed nuts are suitable for further use if satisfactory in all other respects.

E. Compile Inspection Records.

- (1) Compile a record for each main bearing and other bearings if required, to show:
 - (a) Part number.
 - (b) Serial number.
 - (c) Engine type and serial number.
 - (d) Manufacturers cast code letters, outer and inner race pairing numbers (if applicable).
 - (e) Running time.
 - (f) Reason for rejection (if applicable).
 - (g) Components.

5. Threaded Components

A. General Examination - All Components.

- (1) Examine all threaded components as described in para.1 of this Chapter.
- (2) Examine all threads for chipping, pick-up, peeling of any plating, tearing, stretching and distortion.
- (3) Examine all components for obvious signs of over-stressing, e.g. waisting of bolts, local distortion of bolt locations, etc.
- (4) Check all threads for wear using a thread gauge to suit the thread standard.
- (5) Examine spanner locations for excessive bruising.
- (6) Examine specific types of threaded components as described in subsequent paragraphs.

B. Examine Self-locking Nuts.

NOTE: All self-locking nuts are reusable providing that they satisfy the following examination and meet the minimum locking (run-down) torque specified in the appropriate Sub-assembly Chapter, or if not specified, must be as quoted in Table 318.

- (1) Examine for damage, cracking and corrosion. Reject defective nuts.

C. Examine Captive Self-locking Nuts (Esna and Kaylock Type).

- (1) Examine for security, damage, cracking and corrosion. Renew defective nuts (Ref. 72-09-00 Repair).
- (2) Check the locking (run-down) torque.
 - (a) Lubricate the thread of the mating bolt as required for assembly (Ref. appropriate Sub-assembly Chapter).
 - (b) Screw the bolt into the nut until the end of the bolt is flush with, or slightly protruding from, the outer face of the nut. Ensure that the thrust face of the bolt is clear of the component face.
 - (c) Using a direct reading torque spanner or driver and the appropriate socket, check the locking (run-down) torque required to turn the bolt in the nut. This torque shall be within the limits quoted in the appropriate Sub-assembly Chapter, or if not specified, shall be as quoted in Table 318.
- (3) Renew nuts which fail to meet the locking torque requirements (Ref. 72-09-00 Repair).

UNF SIZE	T.P.I.	LOCKING TORQUE	
		MINIMUM	MAXIMUM
O.1900 (No.10)	32	2.0 lbf in. (0,23 N.m)	17 lbf in. (1,9 N.m)
O.2500	28	3.5 lbf in. (0,40 N.m)	35 lbf in. (3,9 N.m)
O.3125	24	6.5 lbf in. (0,73 N.m)	72 lbf in. (8,1 N.m)
O.3750	24	9.5 lbf in. (1,07 N.m)	96 lbf in. (11 N.m)
O.4375	20	14.0 lbf in. (1,58 N.m)	120 lbf in. (14 N.m)

OVERHAUL

D. Examine Captive Self-locking Shank Nuts.

- (1) Check security of nut in component. Replace any nut that permits axial movement (Ref.72-09-00 Repair); radial movement, to abut the nut trap, is acceptable.
- (2) Examine locking element for distortion; replace any nut so damaged (Ref.72-09-00 Repair).
- (3) Examine all swaging for damage; replace any nut with flange damage (Ref.72-09-00 Repair).

NOTE: Silver coating inside shank may be rubbed off during installation. Such damage is acceptable, but any loose flakes must be removed.

- (4) When nuts are found to be otherwise satisfactory, check the locking (run-down) torque as described in sub-para.C.

E. Examine Locking Screw Thread Inserts (Helicoil Type).

- (1) Examine for displacement of inserts from their correct position in tapped holes. Generally, the top of the insert should be between 0.75 and 1.5 thread pitches below the component surface. Renew defective inserts (Ref. 72-09-00 Repair).
- (2) Check the locking (run-down) torque.
 - (a) Lubricate the thread of the mating bolt as required for assembly (Ref. appropriate Assembly Chapter).
 - (b) Screw the bolt into the insert until it is fully engaged with the locking coils in the insert. Ensure that the thrust face of the bolt is clear of the component face.
 - (c) Using a direct reading torque spanner or driver and the appropriate socket, check the locking (run-down) torque required to turn the bolt in the insert. This torque shall be within the limits quoted in the appropriate Sub-assembly Chapter, or if not specified, shall be as quoted in Table 318.

INSPECTION/CHECK

OVERHAUL

- (3) Renew inserts which fail to meet the locking torque requirements (Ref. 72-09-00 Repair).

F. Examine Self-locking Nut and Clip Assemblies.

- (1) Examine for security, damage, cracking and corrosion. Renew defective nuts (Ref. 72-09-00 Repair).
- (2) Check the minimum locking (run-down) torque.
 - (a) Lubricate the thread of the mating bolt as required for assembly (Ref. appropriate Sub-assembly Chapter).
 - (b) Screw the bolt into the nut until the end of the bolt is flush with, or slightly protruding from, the outer face of the nut. Ensure that the thrust face of the bolt is clear of the component face.
 - (c) Using a direct reading torque spanner or driver and the appropriate socket, check the locking torque required to turn the bolt in the nut. This torque shall not be below the limits quoted in the appropriate Sub-assembly Chapter, or if not specified, shall be as quoted in Table 318.
- (3) Renew assemblies which fail to meet the locking torque requirements.

6. Rigid Tubes

A. Examine for Damage.

- (1) Examine for fretting, gouging, scratches and scores, i.e. where metal is displaced.
 - (a) Where the maximum depth of the defect exceeds 15 per cent of the nominal thickness and is not greater than an absolute depth of 0.007 in. (0,180 mm) or 0.005 in. (0,130 mm) fretting at loop clamp locations, proceed as follows:
 - (i) Measure the wall thickness of the undamaged material around the defect (using a Forester Magnetoscope or similar instrument) and subtract the defect depth from this measurement.

TEMPORARY REVISION No. 72-522
Insert in 72-09-00 before page 339

REASON FOR ISSUE:

Fretting limits for No.4 bearing oil feed, scavenge and vent pipes (MRA 78).

ACTION

Read the following NOTE after paragraph 6.A.(1)(a)(ii):

NOTE: Accept fretting on No.4 bearing oil pipes to a maximum depth of 0.010 in. prior to Tribomet plating to CM 425278. Fret marks to be dressed to remove burrs and sharp edges only i.e. do not blend.

Pipes - Oil feed - IPC Ref 72-34-00 Fig.1/80
Oil scavenge - IPC Ref 72-34-00 Fig.1/210
Oil vent - IPC Ref 72-34-00 Fig.1/340

OLYMPUS 593

MK.610-14-28

OVERHAUL

SEE TR

- (ii). Accept fretting up to 0.005 in. (0,130 mm) in depth at loop clamp positions, or damage up to 0.007 in. (0,180 mm) in depth at other areas, provided the minimum section across the defect is not less than the minimum drawing section. Refer to Table 320 for the interpretation of the minimum drawing section after forming and the maximum permissible depth of defect.
- (2) Blend acceptable defects to completely remove them, ensure that a minimum amount of metal is removed.
- (3) Examine for indentations, i.e. no obvious metal displacement.
- (4) Accept indentations provided that:
- (a) They are of smooth contour.
 - (b) They are not deeper than five per cent of the tube outside diameter.
 - (c) The minimum section at the indentation is not less than the minimum drawing section after forming.
- (5) Identify acceptable indentations by electro-chemically marking the letter A adjacent to each indentation (Ref. 72-09-00 Repair).

TUBE THICKNESS			MIN. DRAWING SECTION AFTER FORMING		MAX. PERMISS-IBLE DEPTH OF DEFECT (EXCLUDING CLAMP FRETTING)		MAX. PERMISS-IBLE DEPTH OF LOOP CLAMP FRETTING

7. Tube End Fittings

A. Union Bodies.

- (1) Examine the conical seating to ensure that it has not become spherical due to previous overtightening.
- (2) Check the thread diameter to ensure that it has not become enlarged due to previous overtightening.
- (3) Reject the union body if any defect is found.

B. Union Nuts.

- (1) Check the thread diameter to ensure that it has not become enlarged due to previous overtightening.
- (2) Examine for cracking at the thread undercut (standard type) or in the vicinity of the wire insert (Bowden type).
- (3) Examine the locking wire holes; a minimum of two holes must be sound.
- (4) Examine the spanner locations to ensure that they are not excessively bruised.
- (5) Ensure that the nut is free to rotate on the tube end.
- (6) Examine the end of the thrust wire for corrosion (if applicable).
- (7) Reject the tube if any defect is found.

C. Nipple Ends.

- (1) Examine for distortion and damage, and for ridging or knifing of the seat.
- (2) Reject the tube if any defect is found.

8. Hardness Testing

- A. Hardness testing is used to verify that a component or its surface coating has the required hardness to perform its design function, and is normally carried out on a component when it is subjected to one of the following.

- (1) A case hardened component that has been ground in order to incorporate a modification.

TEMPORARY REVISION NO.72-564

Insert in 72-09-00 after page 340

REASON FOR ISSUE

BEOL NOTE added

ACTION

Add the following NOTE after heading for paragraph 7B

BEOL NOTE: All pipes with union nut connections should have the part number etched in the neck of the union nut.

23 July 1981

TR 72-564
72-09-00
TR Page 1 of 1

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Damage to a hardened steel component that has been blended by stoning.
- (3) A component that has been salvaged by hard chromium plating.
- (4) A component that is suspected of having been overheated. In this case check the hardness on the part of the component which has been subjected to the highest temperature. Except for hot-end components, overheating will be indicated by discolouration of the metal. If there is doubt regarding the cause of discolouration, hardness test the component.

- B. The testing is normally achieved by applying an indenter, at a specific load and for a specific time, to the surface of the component and measuring the resultant impression. This measurement is interpreted in terms of a "hardness value" which must lie within the range quoted in the relevant Chapter for the component concerned.
- C. One of three types of test may be specified, Vickers, Brinell or Rockwell (Scale 'C'). These are denoted by, respectively, the letters HV, HB and HRC preceding the hardness value.
- D. On completion of a hardness test, submit the harness number and the exact location of the test to the Engineering Department for consideration.

9. Surface Roughness

- A. Surface roughness requirements are specified on repair illustrations where necessary (Ref. 72-09-00 Repair). Normally, inspection will be carried out using test equipment designed for this purpose. In certain instances, inspection may be by a tactile and visual comparison between the component and a test piece of known surface roughness.
- B. It is not intended that all locations where a surface roughness is specified are 100 per cent inspected for this requirement. The number of components and the frequency of checks to be carried out will be decided by the inspection and quality departments of the repair facility concerned, with the object of ensuring that the equipment used is capable of producing the required finish.

INSPECTION/CHECK

72-09-00

Page 341

Jun 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

sneema

- C. The direction in which the measurement for surface roughness is made should be approximately at right angles to the "lay" (direction of tool marks in the surface), unless otherwise specified. The measurement should preferably be taken in five locations and the results averaged to determine the surface roughness value.
- D. In locations which do not permit ready access of the stylus or probe of the surface roughness test equipment, a plastic mould of the location should be made and the roughness checked on the surface of the mould.
- E. It is emphasized that checking the surface roughness using test equipment will not necessarily reveal irregularities in machining, isolated scratches or similar imperfections. Therefore, normal visual inspection for such defects must be carried out on all surfaces affected by a repair.

10. Rim Clenching Clamp Assemblies

A. Bedding Check.

- (1) Install the appropriate checking gauge in a vice. For the main hydraulic pump securing clamp use Tool 74 and for the standby hydraulic pump securing clamp use Tool 75.
- (2) Clean the taper surfaces of the checking gauge using a clean, lint-free cloth moistened with a group 1 or 3 solvent (Ref.72-09-00 - Cleaning) then apply a thin coat of "engineer's blue" to these surfaces.
- (3) Install the clamp assembly on the checking gauge (Ref. 72-09-00 Assembly), omitting the lubrication of the taper surfaces, and torque-tighten as specified.
- (4) Remove the clamp assembly from the checking gauge and examine the clamp segment taper surfaces. These surfaces must show a minimum of 80 per cent circular contact and 60 per cent radial contact with the checking gauge, as indicated by the blue marking.
- (5) Remove the blue from the checking gauge and clamp assembly using a suitable solvent and apply de-watering oil as a temporary protective.

INSPECTION/CHECK

72-09-00

Page 342

Jun 1/96

OLYMPUS 593

MK.610-14-28

OVERHAUL

11. Cupwashers

A. Cupwasher can be accepted for further service provided that:

- (1) General condition is acceptable.
- (2) Lugs are not damaged.
- (3) There is no evidence of incipient cracking.
- (4) Reconditioning limits can be met (Ref. 72-09-00 Repair).

12. Springs

A. Springs shall be visually examined for corrosion, damage, distortion or evidence of overheating.

B. Where a load check is specified in the relevant Chapter, the spring shall be checked on a calibrated machine designed for this purpose.

- (1) Install a slip gauge of the specified spring length in the machine, bring the compression pad into contact with the gauge and zero the dial test indicator (dti); remove the gauge.
- (2) Install the spring in the machine and lower the compression pad to compress the spring until the dti reads zero.
- (3) Read off the spring load on the load scale. This load must be within the limits specified for the spring in the relevant Chapter.
- (4) Remove the spring from the machine.

C. Springs which fail the visual examination or the load check shall be scrapped.

13. Light Band Surface Flatness Check

A. General.

- (1) This check is used to determine the flatness of surfaces on certain critical components, especially where a leak-resistant joint between running or mating components is required.

INSPECTION/CHECK

72-09-00

Page 343

Jun 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

sneema

B. Prepare the Component.

- (1) Lightly lap the surface to be checked to remove any slight burrs.
- (2) Degrease the component using a clean, lint-free cloth moistened with a group 1 or 3 solvent (Ref.72-09-00 - Cleaning)
- (3) Polish the surface to be checked using a clean, dry, lint-free cloth.

C. Examine the Component (Ref.Fig.303).

- (1) Switch on and warm up the monochromatic helium light source.
- (2) Place the component, surface to be checked up, centrally in the illuminated area.
- (3) Place the optical flat, working surface (indicated by arrow) down, centrally on top of the component.
- (4) Examine the light band pattern displayed at the component/optical flat interface (Ref.Fig.304).

NOTE: An acceptable pattern should have well defined bands of uniform width. The bands should be straight or uniformly curved. If they are curved, a straight line drawn tangentially to the centre of one band must not intersect more than the number of bands specified in the applicable Chapter.

NOTE: The configuration of most components which are checked by this method is such that the overall pattern of light bands will have to be estimated from the portion of the pattern actually displayed.

- (5) If the pattern displayed indicates that the component is not acceptable, repeat the lapping, degreasing and polishing procedure, then re-check the component. Reject the component if still not acceptable.
- (6) Temporarily protect the component using approved dewatering oil.

14. Squareness Checks on Splined Components

NOTE: For the purposes of squareness checks the master spline on internal splines will count as two splines with one serration uncut, conversely the master slot on external splines will count as two serrations with one spline removed.

A. General.

- (1) This check is used to ensure that distortion has not occurred during engine run and that compatibility of mating components is maintained.

B. Prepare the Component (Ref.Fig.305).

- (1) Select four equally spaced splines as datum points for the dimensional checks. A convenient method of identifying the correct splines is as follows.

NOTE: The dimensions, on a component containing 87 splines and pitched as for 88 for example, are taken across 22 splines.

- (a) Establish the number of splines on the component and identify the master spline.
- (b) Identify the second spline clockwise from the master spline. Temporarily mark this spline (Ref.para.3) and identify it as No.1 spline. Continuing clockwise, identify and mark the four splines required for the dimensional check e.g. in the case of a spline pitched as for 88 splines, the 22nd, 44th, 66th and 88th splines clockwise from the No.1 spline will be marked. Ensure that the 88th spline, as in the example, is immediately anti-clockwise of No.1 spline. Recheck if necessary.

- (2) Mark the selected splines (Ref.para.3).

C. Carry Out Dimensional Check.

- (1) Using suitable inspection equipment, determine the squareness of the component by taking the dimensions across the flanks of the marked splines.
- (2) Check and record the dimensions for each component as specified in the Fits and Clearances Schedule.

15. Identification of Components

A. General.

- (1) With the exception of small items, each component will be identified by series of alpha-numerics, the numbers off, position and form of markings will vary, depending on the components size, shape and material. The various alpha-numerics that may be found and what they represent are detailed as follows.

B. Material Batch/Code Number.

- (1) The batch/code number is the manufacturers identification of where and when the component was produced and is recorded on the data recording/retrieval inspection records. It is identified by a , followed by letters denoting the contractor, and numbers denoting when the batch was produced. The symbol may point towards, or be above the batch/code numbers as space dictates. A letter C preceding the symbol denotes the component is subject to Customs and Excise control.

Examples  BAA99  RAZ80 C  AZA66

- (2) The batch/code number will not exceed five digits, but an oblique stroke followed by additional code letters and/or numbers will refer to a heat treatment that has been carried out on the item. The heat treatment identification will not be recorded on the data recording/retrieval inspection records.

C. Locational Code/Serial Number.

- (1) The code/serial number is the manufacturers identification of where the component is produced and is recorded on the data recording/retrieval inspection records. Each single piece component or a fabricated component with two or more pieces of material that are permanently joined will be identified by a , while an assembly will be identified by an O. In each instance the symbol will be followed by a location serial number.

Examples  RBC23  BAB60  CE567  WB432

INSPECTION/CHECK

OVERHAUL

D. Part Number.

- (1) The part number is the manufacturers identification of a component. Each component or a fabricated component that is permanently joined will be identified by a letter B followed by six numbers. The part number is the reference used in the Illustrated Parts Catalogue for ordering spares or replacing components. B numbered components with a PM suffix are supplied in the part machined form.
- (2) If the component is without a B identification, it will be a National Standards Part component and may be identified by A, SP, AGS, AS, AN, MS, NAS, FBS, FB, UBS or U.

E. Salvage Number.

- (1) The salvage number will only be found on components that have had a repair carried out and will be identified by a SAL. B. followed by six numbers.

Example SAL. B.476923

- (2) During manufacture minor defects, corrections, faults etc. may have been accepted by minor concessions, with possible minor salvage which will be identified by an MC or CON.

F. Miscellaneous Numbers.

- (1) Bevel gears will have a mounting distance MD number which is a dimension used in the manufacture of the gears and will be required during the setting up of the gears to their correct position during assembly. Other markings found on gears may be SET and TV.
- (2) Components may have a laboratory identification L followed by numbers, which will refer to a manufacture heat treatment, or some other process.
- (3) Depending on the component and whether it has had numerous forms of machining, or is fabricated, inspection checks denoted by a BA may have been applied. The BA and a number may be contained in a circle.

16. Fluorosilicone Face Seals

A. General.

- (1) All fluorosilicone face seals are re-usable.
- (2) Any damaged seals and those not acceptable to the limits set out below are to be returned to the manufacturer for rebonding, a recommended minimum economical batch for repair will be 20.

B. Examine Fluorosilicone Face Seals.

- (1) Examine the fluorosilicone bonding to ensure positive attachment to the plate.
- (2) Check the stand up of the seal lip from the plate ensuring a minimum stand up of 0.005 in. (0,130 mm).
- (3) Examine the primary and secondary rubber sealing rims to ensure that they are completely intact around their circumference and are free of any cuts and nicks.
- (4) Reject the fluorosilicone seal for repair where any defects are found.
- (5) Examine fluorosilicone seal plate for nicks, burrs, wear, distortion and corrosion.
- (6) Reject the seal plate for renewal where any defects are found.

TERM AND ASSOCIATED TERMS	DEFINITION
------------------------------	------------

Battered (Damaged
by Impacts)

Damaged by repeated blows or impacts
(not humanly inflicted).

TERM AND ASSOCIATED TERMS	DEFINITION
Bent (Creased, Folded, Kinked or Leaning)	Sharp deviation from original line or plane usually caused by lateral force. Examples are: kinked pipe, creased or folded sheet metal.
Binding (Sticking or Tight)	Restricted movement such as tightened or sticking condition resulting from high or low temperature, foreign object jammed in mechanism, etc.
Bowed	Curved or gradual deviation from original line or plane usually caused by lateral force and/or heat.
Brinelled	Surface indentations on bearing races usually caused by repeated shock loading of the bearing, i.e., ball or roller indentation.
Brittle (Perished)	Resilience of material not to specification.
Broken (Fractured)	Separated by force into two or more pieces.
Bulged (Ballooned or Swollen)	Localized outward or inward swelling usually caused by excessive local heating and/or differential pressure.
Burned (Charred)	Destructive oxidation usually caused by higher temperature than the parent material can withstand.
Burr	A rough edge or a sharp projection on the edge or surface of the parent material.

TERM AND ASSOCIATED
TERMS

DEFINITION

Carboned (Carbon covered, Carbon tracked or Coked)	Accumulation of carbon deposits.
Chafed (Scraped or Scuffed)	Frictional wear damage usually caused by two parts rubbing together with limited motion.
Chipped	A breaking away of the edge, corner or surface of the parent material usually caused by heavy impact (not flaking).
Collapsed (Crushed)	Inward deformation of the original contour of a part usually due to high pressure differentials such as a collapsed bellows.
Corroded (Rusted, Oxidation, Etched or Sulphidation)	Gradual destruction of the material by chemical action. Often evidenced by oxide build-up on the surface.
Cracked	Visible (not requiring special fluorescent or magnetic penetrants) partial separation of material which may progress to a complete break.
Crossed	Material damage to parts (as in the case of crossed threads) or part rendered inoperative (as in the case of crossed wires) as a result of improper assembly.
Curled	A condition where the tip(s) of compressor blades or turbine buckets have been curled over due to rubbing action.

TERM AND ASSOCIATED
TERMS

DEFINITION

Dented	An indentation usually caused by impact of a foreign object. Parent material is displaced, seldom separated.
Deposits (Metalized)	A build-up of material on a part either from foreign material or from another part not in direct contact.
Disengaged (Separated or Loose)	Applies only to a detail that is normally permanently affixed to another part.
Disintegrated (Shattered)	Separated or decomposed into fragments resulting in a complete loss of original form (e.g. disintegrated bearings).
Distorted (Buckled, Depressed, Twisted or Warped)	Extensive deformation of the original contour of a part usually due to impact of a foreign object, structural stresses, excessive localized heating or any combination of these.
Eccentric (Non-concentric)	Part(s) wherein the intended common center is displaced significantly.
Eroded	Carry away of material by flow of fluids or gases, accelerated by heat or grit.
Feathered (Edge) - Not Propeller	Thinning of material.
Flattened Out	Permanent deformation beyond tolerance limits usually caused by compression.

TERM AND ASSOCIATED
TERMS

DEFINITION

Frayed	Worn into shreads by rubbing action.
Fused	Joining together of two materials usually caused by heat, friction, or current flow.
Galled (Fretted or Spiked)	Chafing or severe fretting caused by slight relative movement of two metal surfaces under high contact pressure.
Glazed	Undesirable development of a hard, glossy surface due to rubbing action, heat, varnish or non-uniform loading.
Gouged	Scooping out of material usually caused by a foreign object.
Grooved (Furrowed or Fluted)	Smooth, rounded furrow or furrows of wear, usually wider than scoring, with rounded corners and smooth on the groove bottom.
Indications	Cracks, inclusions, fractures, etc. not visible without fluorescent or magnetic penetrants.
Melted	Deformation from the original configuration due to heat, friction or pressure as with melted bearings or insulation.
Nicked	A sharp surface indentation caused by impact of a foreign object.
Out-of-Round (Elongated)	Diameters of part not constant.

TERM AND ASSOCIATED
TERMS

DEFINITION

Out-of-Square	Deformation of right angle relationship of part surfaces.
Overheated (Heat discolored, Heated excessively or Hot spot)	Subjected to excessive temperature usually evidenced by change in color and appearance of part.
Peeled (Blistered, Flaked or Exfoliated)	A breaking away or flaking of surface finish such as coating, plating etc. A blistered condition usually precedes or accompanies flaking.
Peened	Closely and evenly distributed indentations caused by a multitude of impacts.
Pick-up	Transfer of metal from one surface to another. Usual cause is the rubbing of two surfaces without sufficient lubrication.
Pierced (Hole in part)	The puncturing of a material.
Pitted	Small irregular shaped cavities in the surface of the parent material usually caused by corrosion, chipping, or heavy electrical discharge.
Plugged (Clogged, Obstructed or Restricted passage)	Pipe, hoses, tubing, channeling, internal passage, etc., which are totally or partially blocked.

Inspection Terminology

TERM AND ASSOCIATED
TERMS

DEFINITION

Porous (Pock-marked or Perforation-weld)	Voids located internally, in the surface or completely through a material. Usually applied to cast material or to welds.
Rolled-over (Lipped or Turned metal)	Lipping or rounding of a metal edge.
Rubbed (Abraded)	To move with pressure or friction against another part - such as compressor rub.
Ruptured (Blown, Burst or Split)	Extensive breaking apart of material usually caused by high stresses, differential pressure, locally applied force or any combination of these. Examples: burst bellows, blown casing, etc.
Scored	Deep scratch or scratches made during part operation by sharp edges of foreign particles.
Scratched	Light narrow, shallow mark or marks caused by movement of a sharp object or particle across a surface. Material is displaced, not removed.
Seized (Frozen, Jammed or Stuck)	Parts bound together because of expansion or contraction due to high or low temperature, foreign object jammed in mechanism, etc.
Sheared (Cut)	Dividing a body by cutting action, i.e., division of a body so as to cause its parts to slide relative to each other in a direction parallel to their plane of contact.

TERM AND ASSOCIATED
TERMS

DEFINITION

Skidding	Surface damage to ball, rollers, and races of bearings. Appearance: silvery frosted over intermittent areas of the surfaces caused by intermittent loading (as during windmilling).
Spalled (Plucked)	Sharply roughened area characterized by progressive chipping away of surface material (Not to be confused with flaking). Usual causes are surface cracks, inclusions or any similar surface injury causing a progressive breaking away of the surface under load.
Spinning	Excessive turning of bearing ring (race) causing damage.
Stretched (Growth)	Enlargement of a part as a result of exposure to operating conditions.
Stripped	A condition usually associated with threads or insulation. Involves removal of material (threads) by force.
Torn	Separation by pulling apart.
Worn	Material of part consumed as a result of exposure to operation or usage.

17. Lapping Sealol Seals and Mating Rings

A. General.

- (1) Lapping of Sealol seals and mating rings must be carried out immediately before assembly to ensure the best possible seal. If more than one week elapses between lapping and assembly, seals and rings must be re-lapped.
- (2) Seals and mating rings must be within the dimensional limits specified in the appropriate section of Inspection/Check.
- (3) After lapping and leak testing, the seals and mating rings are to be kept together as a matched set.

B. Lapping Sealol Seals (Ref.Fig.306).

- (1) Clean the seal using a group 1 or 3 solvent (Ref.72-09-00 - Cleaning) or white spirit.
- (2) If only light lapping/polishing is required, continue with paragraph (3). If heavier lapping is required, machine lap using aluminium oxide powder (20 micro-inches (0,508 micro-metres)) suspended in Abra-lap 2E oil in the ratio of 4 oz/gallon (25 g/l). Ensure that all traces of lapping compound are removed with a group 1 or 3 solvent (Ref.72-09-00 - Cleaning) or white spirit before polishing.
- (3) Lap the carbon seal face to achieve an even, flat surface with flatness better than three helium light bands (Ref.72-09-00 Inspection/Check). For light lapping and polishing, use a ceramic lapping plate. No scores are permitted on the sealing face.
- (4) Clean the Sealol seal with a group 1 or 3 solvent (Ref.72-09-00 - Cleaning) or white spirit.

C. Lapping Mating Rings (Ref.Fig.307).

- (1) Clean the ring using a group 1 or 3 solvent (Ref.72-09-00 - Cleaning) or white spirit.

INSPECTION/CHECK

72-09-00

Page 359

OVERHAUL

sneema

- (2) If only light lapping/polishing is required, continue with paragraph (3). If heavier lapping is required, machine lap using Hyprez Liquid grade MM 142 (heavy removal) and M 133 (light removal) with type 990/140 lubricating fluid. Ensure that all traces of lapping compound are removed with a group 1 or 3 solvent (Ref.72-09-00 - Cleaning) or white spirit before polishing.
- (3) Hand lap and polish the mating face on a ceramic plate to obtain a flatness better than three helium light bands and a finish better than four micro-inches (0,1 micro-metres). No scores are permitted on the sealing face.
- (4) Clean the ring using a group 1 or 3 solvent (Ref.72-09-00 - Cleaning) or white spirit.

D. Vacuum Test.

- (1) Assemble the seal and the ring to the test fixture (Ref.Fig.308). Lightly lubricate the carbon face and the mating ring with engine oil, and place the seal on the ring concentrically.
- (2) Switch on the vacuum pump, open the inlet valve and close the vent valve. Evacuate to 933 millibars and close the inlet valve. Switch off the pump.
- (3) Test for two minutes. A pressure drop less than 8 millibars is acceptable. Seals and mating rings that fail this test must be re-lapped or sent for repair (Ref.72-63-05 Repair).

18. Ultrasonic Inspection

A. General.

- (1) This procedure is an ultrasonic immersion technique for detection of defects in weld build up/substrate interface using 'C' scan presentation.
- (2) The appropriate safety regulations, relevant to the country in which the inspection is to be carried out, must be observed at all times.
- (3) Personnel involved in the preparation and application of these techniques must be fully trained and approved to the satisfaction of the Quality Assurance Authority.

B. Equipment Requirements.

- (1) High resolution ultrasonic flaw detector capable of operating between 10 and 20 MHz. The test unit must be of the pulse echo type employing the 'A' scan presentation.
- (2) Focused ultrasonic transducer (PVdF film type) with focal length between 1.57 in. and 2.75 in. (40 mm and 70 mm) and nominal frequency 10-20 MHz.
- (3) The flaw detector/transducer combination must be capable of detecting a -12 dB signal from a 0.050 in. (1,27 mm) diameter flat bottomed hole (fbh) at a depth of 0.039 in. (1 mm) below the surface and of positioning the gate to start at a depth of 0.035 in. (0,9 mm).

NOTE: The water path may be adjusted for optimum resolution.

- (4) Immersion scanning tank and recording system capable of incrementing the transducer in fine steps and recording the position of any indication detected. The equipment must be capable of varying and controlling the relative movement of the transducer and component to a scan plan, and be able to re-position the transducer over an indication site.

INSPECTION/CHECK

72-09-00

Page 364

Jun 1/96

**OLYMPUS 593**MK.610-14-28
OVERHAUL

sneema

Printed in England

- (5) The returned ultrasonic signals must be gated and the outputs monitored. The monitor gate must be capable of being interface triggered and have position and width controls. Minimum delay from front surface signal is 0.035 in. (0,9 mm) and minimum width 0.079 in. (2 mm).
- (6) The output from the monitor gate must be captured and automatically recorded so that the position of an indication can be identified for assessment later.
- (7) Calibration ring made from similar material to the component, built up with blanket weld to the correct thickness with surface finish 100 micro in. or better. An fbh 0.050 in. (1,27 mm) diameter is to be drilled to a depth corresponding to the weld/substrate interface from the inside diameter of the ring. Minimum depth of fbh is to be 0.039 in. (1 mm).

NOTE: A test ring of outside diameter 7.0 in. \pm 0.5 in. (177,8 mm \pm 12,7 mm) is suitable for inspecting shafts from 5.0 in. (127 mm) outside diameter and above. Smaller diameter shafts will require separate test rings of equal diameter to the shaft. For the LP Rotor Shaft Front (Titanium) which has an outside diameter of approximately 4.5 in. (114,3 mm), it is necessary to increase the sensitivity of the inspection by 3 dB to compensate for the smaller weld diameter.

C. Preparation.

- (1) The surface finish must be machined to 100 micro in. or better, using a round nosed tool to provide optimum near surface resolution.
- (2) Set scanning speed. The maximum scanning speed is dependent upon the test beam diameter, pulse repetition frequency and the number of signal pulses required to trigger the gate monitor alarm.

$$\text{Max scanning speed } V_{\text{max}} = \frac{dt \times P}{2 \times c}$$

where:

V_{max} = max linear in mm per second
 dt = test beam diameter
 P = pulse repetition frequency (Hz)
 c = monitor count function (normally 3 pulses)

INSPECTION/CHECK

72-09-00Page 365
Jun 1/96

**OLYMPUS 593**MK.610-14-28
OVERHAUL

sneema

NOTE: The test beam diameter (dt) is defined as the diameter of the ultrasonic beam at its narrowest point within the inspection zone. It is measured between the points where the signal from an fbh, whose diameter is equal to the quality acceptance requirement, falls 6 dB in amplitude from its maximum.

- (3) Set scanning pitch. The maximum scanning pitch must not exceed half the test beam diameter.

D. Procedure.

- (1) Centralize the calibration ring on the turntable.
- (2) Normalize the transducer to the outside diameter of the calibration ring.
- (3) Rotate the calibration ring to locate the signal from the 0.050 in. (1,27 mm) fbh.
- (4) Maximise the fbh signal by adjusting the transducer position both axially and radially to ensure the ultrasonic beam is focused on the fbh.
- (5) Ensure the fbh signal is adequately resolved from the front surface echo. The minimum signal separation required is 12 dB. Optimum resolution may be achieved by adjusting the water path and calibrated pulse length/damping control.
- (6) Set the monitor gate to echo follow, using the front surface echo as the trigger. Adjust the start to begin immediately after the front surface echo and span the full width of the fbh signal to a depth of 0.079 in. (2 mm minimum).
- (7) Set the gate trigger level as follows:
 - (a) Ensure fbh signal is at maximum amplitude and adjust to 100% screen height.
 - (b) Reduce gain by 6 dB.
 - (c) Adjust gate trigger level to activate at this amplitude.
 - (d) Increase gain by 6 dB.
- (8) Scan the calibration ring to ensure the fbh signal is readily detected.

INSPECTION/CHECK

72-09-00Page 366
Jun 1/96

OLYMPUS 593

MK.610-14-28

OVERHAUL

sneema

- (9) Replace the calibration ring with the component and centralize it to the turntable.
- (10) Normalize the transducer over the areas to be scanned.
- (11) Position the transducer at the start of the scan ensuring same scan speed and increment as the calibration ring.
- (12) Scan the component for flaws at the weld/parent metal interface.

E. Completion.

- (1) Evaluate any indication found on the recording with respect to signal amplitude.
- (2) Signals at the weld/parent metal interface greater than the amplitude quoted in Quality Acceptance Standards for the particular material must be rejected.

MATERIAL	STANDARD
STEEL	0 dB
WASPALLOY	0 dB
TITANIUM	-6 dB

The 0 (zero) dB reading on the oscilloscope is equivalent to the 0.050 in. (1,27 mm) flat-bottom hole standard.

19. Measurement of Corrosion Depth

A. General.

- (1) The technique for replication and measurement of corrosion depth consists of producing a silicon rubber mould of the area to be inspected, and measuring the height of the bumps or nodules which correspond to the corrosion pits, using a calibrated microscope.
- (2) The accuracy of the pit depth measurement depends on the effectiveness of corrosion removal during the cleaning process. The cleanliness of the corrosion pits must be checked before the replication process using a binocular microscope.

INSPECTION/CHECK

72-09-00

Page 367

Jun 1/96

OLYMPUS 593

MK.610-14-28

OVERHAUL

SNECMA

B. Corrosion Definitions.

(1) Superficial corrosion.

- (a) Light corrosion or rusting over the whole or part of the component surface. The corrosion is easily removed by light abrasion without loss of dimension of the component and, after removal, no pitting is visible to the naked eye.

(2) Light surface corrosion.

- (a) Corrosion slightly more extensive than superficial, where powdery surface deposits may sometimes be seen and where, after cleaning, the surface has become visibly roughened. The depth of the surface roughening will be less than 0.002 in. (0,05 mm). Discrete pits are not yet evident and the depth of degree of corrosion is not readily measured using the replica technique.

(3) Isolated pitting corrosion.

- (a) Small individual pits typically up to 0.005 in. (0,13 mm) depth and 0.005 in. (0,13 mm) diameter. The pits may be in groups but where necessary the minimum distance between the outer edges of the pits together with the maximum pit depth will be specified for individual areas under consideration.

(4) Coalesced pitting corrosion.

- (a) Pitting up to 0.005 in. (0,13 mm) depth and typically 0.005 in. (0,13 mm) diameter where individual pits have merged together in small areas. Acceptable pit depths together with the permissible extent of surface degradation and size of the area where the corrosion pits have merged will be specified for individual regions of the components under consideration.

C. Preparation.

- (1) Remove any protective coatings using the cleaning process specified in the appropriate section of the Overhaul Manual (Cleaning).
- (2) Remove all corrosion using the de-scaling process specified in the appropriate section of the Overhaul Manual (Cleaning).

INSPECTION/CHECK

72-09-00

Page 368

Jun 1/96

OLYMPUS 593

MK.610-14-28

OVERHAUL

SNECMA

- (3) If examination does not follow immediately after de-scaling, protect the surface by using de-watering oil as specified in Chapter 72-09-20 Repair.

D. Inspection.

- (1) Degrease the area to be inspected by swab degreasing using a group 1 or 3 solvent (Ref.72-09-00 - Cleaning).
- (2) Inspect the corroded areas using a binocular microscope with 10 to 30 times magnification to ensure that all corrosion has been removed, and to select the worst affected areas for replication.

E. Replication.

- (1) Mask up the affected areas using masking tape or plasticene to form a reservoir for the silicon rubber mix (Ref.Fig.309).
- (2) Mix 10 parts of Silastic J silicon rubber base with one part Silastic J RTV curing agent and mix thoroughly. The resulting mixture should be a pale green in colour. Allow to stand for five minutes to eliminate air bubbles.

NOTE: The silicon rubber mix remains workable for up to one hour, after which it begins to cure. Therefore, it is recommended that only small quantities (approx. 100 g) are made up and worked with at any one time.

- (3) Work the silicon rubber mix into the surface of the affected area using a hard-bristled brush to ensure maximum penetration into the corrosion pits.
- (4) Pour the silicon rubber mix into the reservoir to form a thick layer over the affected area. When replicating disk blade root slots, the entire root slot should be filled (Ref.Fig.309).
- (5) Leave to cure for at least 12 hours at room temperature.

F. Remove Replica.

- (1) Remove the masking from the reservoir.

INSPECTION/CHECK

72-09-00

Page 369

Jun 1/96

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Identify the silicon rubber cast by writing on it the disk slot number, or its position relative to some datum, as required.
- (3) Gently remove the replica from the surface, taking care not to touch the contact faces. Remove replicas from disks slots rearwards.
- (4) Trim excess material from the replica with a knife or scissors, ensuring that the contact surfaces are kept clean.
- (5) Place the replica in a clean plastic bag as soon as possible.

G. Protect Component.

- (1) Clean the replicated component and protect with de-watering oil as specified in Chapter 72-09-20 Repair.

H. Measure Pit Depth.

- (1) Examine the replica using a binocular microscope at 2 to 5 times magnification to identify the areas of bumps or nodules corresponding to the corrosion pits. Mark the areas with a pen.
- (2) Evaporate heavy metal (Au/Pd) onto the marked areas using a coating unit.
- (3) Examine the coated replica using a calibrated microscope with a dial gauge on the vertical focus control.
 - (a) Focus on the top of the chosen bump or nodule. Note the gauge reading.
 - (b) Focus on the base of the bump or nodule. Note the gauge reading.
 - (c) Obtain the height of the bump or nodule from the difference in gauge readings between paragraphs (a) and (b). This equals the depth of the corresponding corrosion pit.
- (4) Repeat the procedure in paragraph (3) as required for other corrosion pits.

ENGINE TURNING - INSPECTION/CHECK1. General

CAUTION: DO NOT TURN HP ROTOR ASSEMBLY UNLESS LUBRICATION HAS BEEN MADE EFFECTIVE BY ENGINE RUN. LABYRINTH RUB AND EXCESSIVE RESISTANCE TO ROTATION OCCURS WHEN BEARINGS HAVE NO OIL SQUEEZE FILM.

Provision is made for turning the HP and LP rotating assemblies using hand operated equipment. The HP assembly is turned through a drive in the right-hand gearbox, while the LP assembly is turned through a drive in the pulse probe drive and housing using the equipment installed as detailed in paragraph 3.

Two alternatives are listed, the adapter assembly allows rotation of the LP and HP rotors, whilst the adapter and immobiliser assembly allows rotation and locking of the LP and HP rotors when carrying out the in-situ blade blending operation (Ref.72-09-31 Repair).

Torque adapter	T2.EP1594
Extension bar	T2.E3312
Adapter and immobiliser assembly	S3S20255000

3. General Hand Turning Equipment - Installation/Removal

A. Install LP Turning Equipment (Ref.Fig.301, Detail A).

- (1) Remove the bolts securing cover to the pulse probe drive and housing flange, withdraw cover.
- (2) Assemble the universal joint and the adapter to the cover flange.
 - (a) Engage universal joint drive with drive in the pulse probe drive and housing.
 - (b) Position adapter on cover flange and, with assembly pin and universal joint engaged, press adapter to abut the cover flange.

- (c) Secure the assembly with three equally spaced bolts torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m) with lubricant A applied.
- (3) Engage the extension bar square drive in the universal joint and assemble the torque adapter to the extension bar.
- (4) Pre-set a torque wrench to between 150 and 180 lbf in. (16,9 and 20,3 N.m) and assemble to the torque adapter.
- (5) Apply a gradual force at the torque wrench to turn the LP rotating assembly.

NOTE: The torque wrench is pre-set to prevent excessive loading should a sudden force be applied.

- (6) If the adapter and immobiliser is being used, hand-tighten the thumbnut to lock the LP rotor in the required position.

B. Install HP Turning Equipment (Ref.Fig.301, Detail B).

- (1) Remove bolts and washers securing blank cover to engine right-hand gearbox cover flange. Withdraw cover.
- (2) Assemble the universal joint and the adapter to the cover flange.
 - (a) Engage universal joint drive with drive in the right-hand gearbox.
 - (b) Position adapter on cover flange and, with assembly pin and universal joint engaged, press adapter to abut the cover flange.
 - (c) Secure the assembly with three equally spaced bolts torque-tightened to between 90 and 100 lbf in. (10,2 and 11,3 N.m) with lubricant A applied.
- (3) Engage the extension bar square drive in the universal joint and assemble the torque adapter to the extension bar.
- (4) Pre-set a torque wrench to between 360 and 400 lbf in. (40 and 45 N.m) and assemble to the torque adapter.

- (5) Apply a gradual force at the torque wrench to turn the HP rotating assembly.

NOTE: The torque wrench is pre-set to prevent excessive loading should a sudden force be applied.

- (6) If the adapter and immobiliser is being used, hand-tighten the thumbnut to lock the HP rotor in the required position.

C. Remove LP Turning Equipment.

- (1) Remove the torque wrench and torque adapter and withdraw extension bar.

NOTE: If the adapter and immobiliser is being used, the thumbnut must be loosened before the extension bar can be withdrawn.

- (2) Remove the bolts securing the adapter to the flange, remove the adapter and withdraw the universal joint.

CAUTION: FAILURE TO CORRECTLY RE-ASSEMBLE THE COVER, INCLUDING THE USE OF A NEW GASKET, WILL LEAD TO RAPID LOSS OF ENGINE OIL CONTENTS DURING FLIGHT.

- (3) Ensure that the cover and new gasket are to the same Service Bulletin standard (Ref. S.B.0L.593-72-41), then assemble gasket and cover to the pulse probe drive and housing flange and secure with seven bolts torque-tightened to between 85 and 95 lbf in. (9,6 and 10,8 N.m) with lubricant A applied.

D. Remove HP Turning Equipment.

- (1) Remove the torque wrench, withdraw the torque adapter and extension bar.

NOTE: If the adapter and immobiliser is being used, the thumbnut must be loosened before the extension bar can be withdrawn.

- (2) Remove the bolts securing the adapter to the gearbox cover flange, remove the adapter and withdraw the universal joint.

OVERHAUL

ENGINE INTERNAL EXAMINATION - INSPECTION/CHECK**1. General**

- A. Internal examination of the engine can be carried out with the engines in the vertical or horizontal attitude, and without dismantling the modules. The examination of the LP and HP compressor blades, turbine blades and combustion chamber is effected by the use of illuminating optical probes of various sizes inserted into the engine through ports in the engine cases. To give full examination coverage, the engine rotating assemblies are turned during the examination (Ref.72-09-01 Engine Turning).
- B. Two types of optical inspection probes are used for internal examinations. Projected light probes which have a cold light output provided by a light source box and light transmitting cable are used to examine the LP and HP compressor rotor blades and the HP and LP turbine rotor blades. Distal light probes connected to a transformer provide a hot light output from a quartz iodine bulb housed at the end of the probe and are used to examine the combustion chamber and HP turbine nozzles.
- C. To obtain permanent records of engine internal damage, photographic equipment is used in conjunction with the internal inspection procedures using the optical inspection probes.
- D. Datum blades on engines of SB.0L.593-72-25 standard can be identified by slots cut in the seventh LP and third and seventh HP compressor rotor disk. On engines of pre SB.0L.72-25 standard, paint marking may be found to have been used in some instances for datum blade identification.
- E. For identification of lubricants and jointing compounds used in this topic refer to (72-09-00 Assembly).
- F. Refer to Para.3 for the inspection acceptance standard terminology used in this topic.
- G. Certain types of blade damage can be repaired in-situ, without dismantling the engine. For details of in-situ blade blending and acceptance limits refer to 72-09-31 LP and HP Compressor Rotor Blades - Repair by In-situ Blending.

3. Terminology for Damage

A. Apply the following definitions to the terms used to describe damage:

- | | |
|------------------------|--|
| (1) <u>Bend</u> | A sharp deviation from original line or plane (associated terms: crease, fold, kink, lean). |
| (2) <u>Break</u> | A separation by force into two or more pieces. |
| (3) <u>Burn</u> | Destructive oxidation usually caused by higher temperature than the parent material can withstand. |
| (4) <u>Chip</u> | A breaking away of the edge, corner or surface of the material. |
| (5) <u>Crack</u> | Visible partial separation of material which may progress to a complete break (Ref. para (2)). |
| (6) <u>Curl</u> | Tips of blades or vanes curled over due to rubbing. |
| (7) <u>Dent</u> | An indentation usually caused by impact of an object; parent metal is displaced, seldom separated. |
| (8) <u>Distortion</u> | Excessive deformation of the original contour of the part (associated terms: buckle, depression, twist, warp). |
| (9) <u>Nick</u> | A sharp surface indentation. |
| (10) <u>Overheated</u> | Subjected to excessive temperature, usually evidenced by change in colour and appearance of the part. |
| (11) <u>Pierced</u> | Puncture of the material. |
| (12) <u>Score</u> | Deep scratch. |

snecma

- (13) Scratch Light, narrow, shallow mark; material is not removed.
- (14) Spalled Sharply roughened area characterised by progressive chipping away of the surface material.
- (15) Tear Separation by pulling apart.

4. Prepare Probe Equipment (Ref.Fig.301)

A. Prepare and Test the Projected Light Probe Equipment.

NOTE: A power supply of 2A at 100V a.c. or 240V a.c. incorporating an earth connection is required for the light source box.

- (1) Ensure that the protective sleeve on the probe is retained in position both during use and storage.
- (2) Ensure that the cable contacts are clean, then connect the cable (Tool 1891) to the socket of the light source box (Tool 1888).
- (3) Check that the light source box (Tool 1888) is switched OFF, then set the brightness control to minimum.

- (4) Check the light source box voltage selector switch.
 - (a) Release the knurled screw at the top of the cover and remove the cover retaining slotted screws. Lift up the cover.
 - (b) Select either 110 V or 240 V as required.
 - (c) Assemble and secure the cover with the knurled screw and slotted screws.
- (5) Ensure that the power supply is turned OFF, then connect the light source box (Tool 1888) lead to the power supply.
- (6) Test the equipment light control.

CAUTION: DO NOT MOVE LIGHT SOURCE BOX WHILE SWITCHED ON OR WITHIN 30 SECONDS OF SWITCHING OFF. BULB FILAMENT IS NOT SHOCK RESISTANT WHEN HOT.

- (a) Switch ON the power supply.
- (b) Adjust the brightness control and check the response at the probe.
- (c) Return the control to the minimum setting, then switch OFF the light source box.

NOTE: The projected light probe is now ready for checking the LP and HP compressors and turbines.

B. Prepare and Test the Distal Light Probe Equipment.

WARNING: QUARTZ IODINE BULBS MUST NOT BE HANDLED IN SERVICE. HANDLING OF BULB WILL CAUSE SURFACE CONTAMINATION WHICH MAY CAUSE BULB TO SHATTER.

NOTE: A power supply of 2 A at 110 V a.c. incorporating an earth connection is required for the distal light probe transformer.

- (1) Ensure that the contacts are clean, then connect the distal probe (Tool 1899) to the transformer (Tool 1900).
- (2) Check that the transformer is switched OFF, then set the brightness control to minimum.

- (3) Ensure that the power supply is turned OFF, then connect the transformer lead to the power supply.
- (4) Test the equipment light control.
 - (a) Switch ON the power supply.
 - (b) Adjust the brightness control and check the response.
 - (c) Return the control to minimum setting, then switch OFF the transformer.

NOTE: The distal probe is now ready for checking the combustion chamber (Ref. para.9.A) or HP turbine nozzles (Ref. para.10.C).

5. Dismantle Probe Equipment

NOTE: On completion of the inspection of the LP and HP compressors and turbines, and the combustion chamber, dismantle the appropriate probe equipment.

A. Dismantle the Projected Light Source Probe Equipment.

- (1) Ensure that the power supply is turned OFF, then disconnect the light source box (Tool 1888) lead from the power supply.
- (2) Disconnect the light transmitting cable (Tool 1891) from the probe and light source box.
- (3) Place the probes and the light transmitting cable in the appropriate storage container.

B. Dismantle the Distal Light Source Probe Equipment.

- (1) Ensure that the power supply is turned OFF, then disconnect the transformer lead (Tool 1900) from the power supply.
- (2) Disconnect the distal probe (Tool 1899) from the transformer.
- (3) Place the distal probe into the appropriate storage container.

6. Examination of Stage 1 LP Compressor Rotor Blades and Stator Vanes

NOTE: The stage 1 LP compressor rotor blades and stator vanes are examined visually through the air inlet case.

A. Examine the Stage 1 Rotor Blades and Stator Vanes.

- (1) Carry out the examination of the stage 1 LP compressor rotor blades and stator vanes in conjunction with the engine inspection build records to establish the details of repaired rotor blades or stator vanes installed during assembly.
- (2) Examine the leading and trailing edges of the stage 1 rotor blades and stator vanes in accordance with the acceptance standards detailed in para.B.(1).
- (3) All acceptable damage on the stage 1 LP compressor rotor blades must be blended and polished in accordance with the in situ blending standard detailed in para.B.(2).
- (4) In-situ repair of damage outside of the acceptance standards detailed in para.B.(1) may be possible. (Refer to 72-09-31, Repair).

B. Acceptance Standards - Stage 1 LP Compressor Rotor Blades and Stator Vanes.

(1) Impact damage (Ref.Fig.303 and 305).

- | | | |
|-----|---|--|
| (a) | Any damage in zone 'A'. | Accept after repair
(Refer to 72-09-31,
Repair) |
| (b) | Damage in Zone 'A1' on stage 1 blade only not exceeding the limits in (i) to (iii). | Accept (subject to acceptance of damage in (c) and (d)). |
| (i) | Nicks or tears on one edge only and blended out to a depth (detail F) not exceeding 0.100 in. (2,5 mm). | |

- (v) Dent in one edge not exceeding a lateral displacement of 0.500 in. (13,0 mm) at stage 1 blade, 0.250 in. (6,0 mm) at stage 1 vane.
- (vi) Tip rubbing with light curling and cracks running from the tip not exceeding in length 0.250 in. (6,0 mm) at stage 1 blade.
- (vii) The tip of the leading edge of the stage 1 blade bent at an angle of not more than 15 deg.
- (viii) Light scratches and scores.

- (2) Carry out in situ blending on all acceptable damage on the stage 1 LP compressor blades to the following standards and limitations (Ref.Fig.304).

CAUTION: DO NOT BLEND CRACKS.

- (a) Blends must be smoothly profiled into an aerodynamic shape and polished to produce a good surface finish. Where two acceptable blends interfere then metal must be removed to produce a coupled blend.
- (b) Scratching and or scoring must be polished out.
- (c) Dye penetrant inspection (Ref.72-09-00 Inspection/Check) must be carried out after all blending.
- (d) Blends occurring within 4.00 in. (100,0 mm) of the tip must be blended out towards the tip.
- (e) Blends carried out on one edge only (details D and E) must not exceed 0.600 in. (15,0 mm) and 0.250 in. (6,0 mm) in depth respectively.

- (f) Blends carried out on both edges (details D and E) must not exceed 0.300 in. (8,0 mm) and 0.120 in. (3,0 mm) in depth respectively.
- (g) A maximum of two blends or one coupled blend is permitted in each zone.
- (h) Torn, rough or scored edges must be blended to a depth 20 per cent greater than the damaged depth.

7. Examination of the LP Compressor Rotor Blades

NOTE: The LP compressor rotor blades are examined by the use of optical inspection instruments inserted through inspection ports arranged in pairs at each stage of the LP compressor case, with the exception of stage 4 which has only a single port. The most convenient port of each pair to be used.

NOTE: The inspection ports for stages 1 to 6 are sealed with blanking plugs retained by bolts, and the stage 7 inspection ports are sealed with washers and screwed plugs.

A. Install the LP Compressor Turning Equipment (Ref.72-09-01 Engine Turning).

B. Prepare the LP Compressor Case for Examination (Ref.Fig.306 and 307).

- (1) Remove an accessible blanking plug from each port at stages 1 to 6.
 - (a) Remove the bolt securing the blanking plug to the plug support.
 - (b) Use the extractor (Tool 1887) and withdraw the blanking plug from the plug support.
- (2) Unscrew the blanking plug from stage 7 and remove together with the washer.

OVERHAUL

C. Examine the Rotor Blades.

(1) Examine each stage of the compressor blades through the locations as follows:

(a) Insert the probe and ensure free penetration.

NOTE: The protective sleeve (Tools 1893, 1895, 1897 and 3081) must be retained on the probe at all times except when removal is essential for insertion of the probe or its effective use when inserted.

(b) Switch on the probe illumination and commence examination.

NOTE: Refer to Table 301 for number of rotor blades per stage.

LP Compressor Stage	Quantity Per Stage
1	19
2	25
3	33
4	34
5	33
6	29
7	33

LP Compressor Blades
Table 301

(c) Carefully examine the blades for damage by changing the probe position or varying the depth of insertion. Turn the engine as necessary to ensure full coverage of all surfaces to be examined.

(d) Record the extent of any damage found and compare with the acceptance limits given in para.E. If a photographic record of the damage is required, use the equipment and procedures detailed in 72-09-04 Inspection/Check, or equivalent.

- (2) On completion of the compressor examination, switch off the illumination and withdraw the probe.
 - (3) If no further examinations are required, dismantle the equipment (Ref. para.5.A).
 - (4) If no further examinations of the LP assemblies are required, remove the turning equipment (Ref.72-09-01 Engine Turning).
- D. Install the Blanking Plugs Removed for Internal Examination (Ref.Fig.306 and 307).
- (1) Apply lubricant 'B' to the bolts (72-31-01/1-30/220, 2-30/230, 3-30/230) and the stage 7 blanking plugs (72-31-02/1-130) and washers (72-31-02/1-140).
 - (2) Install each blanking plug (72-31-01/1-40/230, 2-40/240, 3-40/240) in its respective port at stages 1 to 6.
 - (a) Ensure that the blanking plug and plug support are clean and damage free.
 - (b) Carefully insert the blanking plug spigot fully into the plug support bore.
 - (c) Secure the blanking plug in position on the plug support with the retaining bolt. Torque-tighten the bolt between 85 and 95 lbf in. (9,6 and 10,7 N.m).
 - (3) Assemble the blanking plug to the port at stage 7.
 - (a) Assemble the washer to the plug and screw into the compressor case.
 - (b) Torque-tighten the plug between 160 and 180 lbf in. (18,1 and 20,3 N.m).
 - (c) Wire-lock the adjacent plugs together.
- E. Acceptance Standards - LP Compressor Rotor Blades Stages 2 to 7.

NOTE: The acceptance standards contained in this chapter are applicable to intrascope inspection only. Information on the stage 1 LP compressor rotor blades and stator vanes is contained in para.6.

8. Examination of the HP Compressor Rotor Blades

NOTE: The HP compressor rotor blades are examined by the use of optical inspection instruments inserted through the most convenient of each pair of ports at each stator stage.

NOTE: The single paired inspection ports at stages 1 and 2 are sealed with blanking plugs, retaining plates and bolts and those at stages 5 and 6 with blanking plugs and washers. Twin ports at stages 3 and 4 are sealed with spherically seated blanking plugs and locknuts. Spherically seated blanking plugs are used at stage 7 ports.

- A. Install the HP Compressor Turning Equipment (Ref.72-09-01 Engine Turning).
- B. Prepare the HP Compressor Case for Examination (Ref.Fig.310 and 311).

(1) Remove an accessible blanking plug from the position at the stage to be inspected as follows.

- (a) Stages 1 and 2. Unscrew and withdraw the blanking plug. Do not remove the retaining bolts or the retaining plate.
- (b) Stages 3 and 4. Slacken the locknut, unscrew and withdraw the blanking plug complete with the locknut.

NOTE: Alternative Stage 4 blanking plug (Ref. Fig.310, Sheet 1 of 2) and Fig.311, Sheet 1 of 2). Unscrew and remove the blanking plug.

- (c) Stages 5 and 6. Unscrew and remove the blanking plug and washer.
- (d) Stage 7. Unscrew and withdraw the blanking plug.

NOTE: Alternative Stage 7 blanking plug (Ref. Fig.311, Sheet 1 of 2). Unscrew and remove the blanking plug.

C. Examine the Rotor Blades.

(1) Examine each stage of the compressor blades through the locations as follows.

(a) Insert the probe and ensure free penetration.

NOTE: The protective sleeve (Tools 1895 and 1897) must be retained on the probe at all times except when removal is essential for insertion of the probe or its effective use when inserted.

(b) Switch on the probe illumination and commence examination.

NOTE: Refer to Table 302 for number of rotor blades per stage.

(c) Carefully examine the blades for damage by changing the probe position or varying the depth of insertion. Turn the engine as necessary to ensure full coverage of all surfaces to be examined.

(d) Record the extent of any damage found and compare with the acceptance limits given in para.E. If a photographic record of the damage is required, use the equipment and procedures detailed in 72-09-04 Inspection/Check, or equivalent.

- (2) On completion of the compressor examination, switch off the illumination and withdraw the probe.

NOTE: If the inspection of the combustion chamber internal surfaces/fuel sprayers, or the HP turbine rotor/nozzles are to be carried out, phase them in at this stage.

- (3) If no further examinations are required, dismantle the equipment (Ref.para.5.A).
- (4) If no further examinations of the HP assemblies are required, remove the turning equipment (Ref.72-09-01 Engine Turning).

D. Install the Blanking Plugs Removed for Internal Examination (Ref.Fig.310 and 311).

- (1) Assemble blanking plugs to stages 1 and 2.
 - (a) Apply lubricant 'A' and screw the blanking plug (72-33-01/1-230/430) into its location.
 - (b) Torque-tighten the plug to 65 lbf in. (7,3 N.m). Wire-lock the plug and adjacent bolts together.
- (2) Assemble blanking plugs to stages 3 and 4.
 - (a) Ensure that the locknut (72-33-01/2-30/130) is screwed back under the head of the blanking plug (72-33-01/2-40/140).
 - (b) Apply lubricant 'A' and screw the blanking plug into its location, then torque-tighten the plug to 70 lbf in. (7,9 N.m).
 - (c) Hold the plug with a spanner to prevent turning, then screw in the locknut and torque-tighten to 370 lbf in. (41,8 mm). Wire-lock the locknut to the adjacent locknut.

- (3) Procedure for ports at Stage 4 when flanged blanking plug is used.
 - (a) Apply lubricant A and screw blanking plug (72-33-01/2A-123) into its location.
 - (b) Torque-tighten plug to 65 lbf in. (7,3 Nm) and wire-lock plug to adjacent bolts.
- (4) Assemble blanking plugs to stages 5 and 6.
 - (a) Assemble the washer (72-33-01/4-310 and 5-420) to the blanking plug (72-33-01/4-300 and 5-410).
 - (b) Apply lubricant 'A' and screw the blanking plug into its location. Torque-tighten the plug to 65 lbf in. (7,3 mm), then wire-lock to the adjacent plug.
- (5) Assemble blanking plugs to stage 7.

Apply lubricant 'A' and screw the blanking plug (72-33-01/3-80) into its location. Torque-tighten the plug to 70 lbf in. (7,9 N.m), then wire-lock to the adjacent plug.
- (6) Procedure for ports at Stage 7 when flanged blanking plug is used.
 - (a) Apply lubricant A and screw blanking plug (72-33-01/3A-073) into its location.
 - (b) Torque-tighten plug to 65 lbf in. (7,3 Nm) and wire-lock plug to adjacent bolts.

E. Acceptance Standards - HP Compressor Rotor Blades Stages 1 to 7.

- (1) Carry out the internal examination of the HP compressor blades in conjunction with the engine inspection build records to establish details of repaired rotor blades installed during assembly.

- (3) Remove the blanking cover from the bottom inspection port.
 - (a) Position a container to catch any residual fuel.
 - (b) Remove the bolts securing the blanking cover to the CCOC.
 - (c) Withdraw the blanking cover and gasket (SB.0L.593-72-58) from the engine.
 - (d) Wipe any fuel deposits from the inspection port area.
- (4) Remove blanks from the HP compressor diffuser case.
 - (a) Use a crowfoot spanner and unscrew and remove blanking plugs and flat washers from the two lower ports and one upper port of the HP compressor diffuser case.
- (5) Ensure that the optical inspection equipment (transformer (Tool 1900)) has been prepared and tested (Ref.para.4.A).

B. Examine the Combustion Chamber.

- (1) Commence the examination using the probe (Tool 1899), used in conjunction with the transformer (Tool 1900), inserted through the CCOC ports.

WARNING: CHECK PERIODICALLY AND REMOVE RESIDUAL FUEL DRAINAGE AT LOWER PORT POSITION AND FROM PROBE. FUEL COULD ENTER EYES DURING EXAMINATION SEQUENCE.

WARNING: QUARTZ IODINE BULBS MUST NOT BE HANDLED IN SERVICE. HANDLING OF BULB WILL CAUSE SURFACE CONTAMINATION WHICH MAY CAUSE BULB TO SHATTER.

CAUTION: DO NOT USE FORCE TO EFFECT PROBE ENTRY AND PREVENT PROBE FROM BECOMING DENTED OR BENT. INVESTIGATE ANY OBSTRUCTION TO PROBE PENETRATION.

- (a) Insert probe through inspection port, switch on probe illumination and commence examination of:

- (i) The vaporisers and internal surfaces of the combustion chamber including the HP turbine nozzles.
 - (ii) The annulus between the combustion chamber outer surface and the CCOC (Ref.Fig.315A).
- (b) Record details of damage found.
- (i) Record extent of any damage to sub-sections of combustion chamber (Ref.Figs.315 to 315B) and compare with acceptance limits given in para.D. If a photographic record of the damage is required, use the equipment and procedures detailed in 72-09-04 Inspection/Check, or equivalent.
- NOTE: If the HP turbine nozzle inspection is to be carried out, phase it in with this sequence.
- (ii) Record the approximate size and the position of any debris found in the annulus between the combustion chamber and the CCOC.
- (c) On completion of examination, switch off probe illumination and withdraw probe.
- (d) Stow optical inspection equipment (Ref.para.5B).
- (2) Examine No.2 Outer Cooling Ring Through CCOC Inspection Ports A and B (Ref.Fig.314) Using Guide Tubes.

CAUTION: WHEN REMOVING THE GUIDE TUBE FROM ITS FIXTURE, ENSURE IT IS INSTALLED CORRECTLY BEFORE REMOVAL AND THAT THE GUIDE TUBE PROFILE MATCHES EXACTLY THE PROFILE OF ITS FIXTURE.

- (a) Remove selected guide tube from its storage fixture.

INSPECTION/CHECK

CAUTION: USE NO FORCE TO INSERT GUIDE TUBES. ENSURE GUIDE TUBES ENTER THE COMBUSTION CHAMBER THROUGH THE CCOC PORT AND THE CORRECT CHAMBER PLUNGING AND DO NOT ENTER THE SPACE BETWEEN CCOC AND CHAMBER.

- (b) Install selected guide tube to CCOC inspection port necessary to inspect the required cooling ring zone (Ref.Fig.315C), using two slave bolts. Care must be taken to ensure the bolts do not inadvertently enter the inspection port and are not overtightened.

CAUTION: ENSURE THE TIP OF THE PROBE IS STRAIGHT WHEN REMOVING THROUGH THE GUIDE TUBES TO AVOID DAMAGE.

- (c) Install probe to light source, insert through guide tube and locate in No.2 cooling ring slot. Switch on probe illumination and commence examination of cooling ring.

NOTE 1: It may be necessary for a second operative to be employed during the probe inspection to hold the probe eye-piece whilst the first operative keeps radial pressure on the probe to keep it in the cooling hole slot.

NOTE 2: The operative may find it easier to feed-in the full amount of necessary probe through the guide tube and inspect whilst engaging backward movement.

NOTE 3: It is possible when fitting the longer guide tubes, to bolt in position and find that the cooling ring end is slightly out of position. In this event, loosen the slave bolts and slightly re-adjust the guide tube until probe in the correct position, then re-tighten slave bolts, taking care not to overtighten.

- (d) Record details of any damage found and compare with acceptance limits given in para.D.
- (e) On completion of the examination, remove the probe.
- (f) Switch off probe illumination and disconnect probe from light source.

CAUTION 1: ENSURE ALL GUIDE TUBES ARE REMOVED ON COMPLETION OF INSPECTION.

CAUTION 2: USE NO FORCE TO REMOVE GUIDE TUBES.

- (g) Remove guide tubes from inspection ports.

CAUTION: WHEN INSTALLING GUIDE TUBE TO ITS FIXTURE, ENSURE IT IS INSTALLED CORRECTLY WITH THE TUBE PROFILE MATCHING THE FIXTURE PROFILE EXACTLY.

- (h) Stow inspection equipment in its storage fixture.

C. Install the Blanking Covers Removed for Internal Examination.

- (1) Assemble the blanking cover to the left-hand inspection port (Ref.Fig.314, detail A).
 - (a) Apply lubricant 'A' to bolts (76-21-01/2-70).
 - (b) Secure the cover (76-21-01/2-80) with six bolts, torque-tighten to 100 lbf in. (11,4 N.m).
 - (c) Wire-lock bolts together.

D. Acceptance Standards - Combustion Chamber.

- (1) Carry out the internal examination of the combustion chamber in conjunction with the engine inspection build records to establish details of the build/repair standard of the combustion chamber.
- (2) Examine the combustion chamber in accordance with the acceptance standards detailed in (3).
- (3) Acceptance standards (Ref.Fig.315).
 - (a) Fuel Vaporisers.
 - (i) No defects are acceptable in the vaporisers.
 - (ii) Obvious signs of overheating or burning should be reported to the Olympus Project Office, Rolls-Royce plc., Filton, Bristol, England, BS34 7QE.
 - (b) Thermal Barrier Coating.
 - (i) Small areas of chipping and/or spalling of thermal barrier coating (TBC) are acceptable. Loss of TBC may, however, reduce the life potential of the combustion chamber.
 - (c) Head Assembly.
 - (i) Front fairing burns/blisters are not acceptable.
 - (ii) Circumferential cracking at the front fairing/No.2 cooling ring welds is not acceptable.
 - (iii) Axial cracking forward of the front fairing/No.2 cooling ring welds is not acceptable.

INSPECTION/CHECK

- (iv) Axial cracks in the No.2 cooling rings originating from the No.2 cooling ring scoops are not acceptable (Ref.Figs. 315E and 315F). If found, report findings to the Olympus Project Office, Rolls-Royce plc., Filton, Bristol, England, BS34 7QE.
- (v) Loss of material from the No.2 outer cooling ring scoop is not acceptable (Ref.Fig.315A).

NOTE: Complete viewing of this location is not possible. However, any material missing from the scoop would be carried rearwards to become trapped in the annulus between the combustion chamber and CCOC or against the HE igniter and pilot nozzle. In most instances, the debris would tend to drop to the bottom of the annulus.

- (vi) Circumferential cracking between cooling holes in the No.2 outer cooling ring is not acceptable (Ref.Fig.315G).
- (vii) Circumferential cracking between cooling holes in the No.2 inner cooling ring is not acceptable (Ref.Fig.315H).
- (viii) Cracks in the No.2 inner and outer cooling ring flameside lips extending into, through, or originating from, blown holes are not acceptable. (Ref.Fig.315J).
- (d) Inner and Outer Barrels.
 - (i) Any number of cracks in any cooling ring flameside lip including No's.3, 4, 5, 6 inner and outer and No.7 inner cooling rings but excluding No.2 cooling rings, are acceptable provided they do not propagate through the cooling holes into the barrel section (Ref.Fig.315K).
- (e) Any other damage that fails to meet the limits detailed in (a), (b), (c) and (d), reject.

10. Examination of the HP Turbine Rotor Blades and Nozzle Vanes

NOTE: The HP turbine rotor blades leading edges are examined by the use of an optical inspection probe inserted through a sealed port located in the combustion chamber outer case (CCOC) rearward of the thermocouple junction box. The trailing edges of the turbine rotor blades are accessible through sealed ports located in the CCOC rearward of the fuel drains tank.

NOTE: The leading edge regions of the HP turbine nozzle vanes are examined by the use of a probe inserted through three inspection ports provided in the CCOC.

- A. Install the HP Rotating Assembly Turning Equipment (Ref.72-09-01 Engine Turning).

NOTE: If examination of the HP compressor rotor blades has been carried out, the turning equipment will be assembled.

- B. Prepare the HP Turbine Rotor Blades and Nozzle Vanes for Examination (Ref.Fig.314, 316 and 317).

- (1) Remove the flanged sealing bar from the CCOC (Ref.Fig.316).
 - (a) Remove the bolts securing the cover plate and the flanged sealing bar and detach the cover plate.
 - (b) Withdraw the flanged sealing bar from the engine.
- (2) Remove the flanged sealing bar from the CCOC (Ref.Fig.317).
- (3) Remove the blanking covers from the CCOC inspection ports (Ref.Fig.314).
 - (a) Remove attachment bolts and blanking cover from the CCOC left-hand inspection port (detail A).

- (b) Remove attachment bolts and cover from right-hand inspection port together with spacer plate on engines to SB.72-8629-256 standard (detail B).
- (c) Remove blanking cover from the bottom inspection port (detail C).
 - (i) Position a container to catch any residual fuel.
 - (ii) Remove the bolts securing the blanking cover to CC0C.
 - (iii) Withdraw blanking cover from the engine and gasket (SB.72-58).
 - (iv) Wipe any fuel deposits from the inspection port area.
- (4) Ensure that the optical inspection equipment (light source box (Tool 1888) and cable (Tool 1891)) have been prepared and tested (Ref. para.4.A).

C. Examine the Rotor Blades and the Nozzle Vanes.

CAUTION: DO NOT MOVE LIGHT SOURCE BOX WHILE SWITCHED ON OR WITHIN 30 SECONDS OF SWITCHING OFF. BULB FILAMENT IS NOT SHOCK RESISTANT WHEN HOT.

- (1) Commence the examination using the probe (Tool 1892), used in conjunction with the light source box (Tool 1888) and cable (Tool 1891), inserted through the ports in the CC0C (Ref. Fig. 316).

- (a) Insert the probe (Tool 1892) and ensure free penetration.

NOTE: The protective sleeve (Tool 1893) must be retained on the probe at all times except when removal is essential for insertion of the probe or its effective use when inserted.

- (b) Switch on the probe illumination and commence examination.

NOTE: There are 87 HP turbine rotor blades per set.

- (c) Carefully examine the leading edge region of the turbine rotor blades for damage, signs of blockage or evidence of debris wrapped around the leading edges. Turn the engine changing the probe position and varying the depth of insertion as necessary to obtain coverage.
 - (d) Record the extent of any damage or debris found for comparison with the acceptance limits given in para.F. If a photographic record of the damage is required, use the equipment and procedures detailed in 72-09-04 Inspection/Check or equivalent.
- (2) Change the probe position (Ref.Fig.317) and carefully examine the trailing edge region of the turbine rotor blades using the same probe insertion procedure (Ref. para.(1)).
 - (3) On completion of examination switch off the illumination and withdraw the probe.
- NOTE: If the inspection of the LP turbine is to be carried out, phase it in with this sequence.
- (4) If no further examinations are required, dismantle the equipment (Ref.para.5.A).
 - (5) Continue with examination of the HP turbine nozzle vanes using probe (Tool 1899), used in conjunction with the transformer (Tool 1900), inserted through the CCOC ports (Ref.Fig.314).

WARNING: CHECK PERIODICALLY AND REMOVE RESIDUAL FUEL DRAINAGE AT LOWER PORT POSITION AND FROM PROBE. FUEL COULD ENTER EYES DURING EXAMINATION SEQUENCE.

WARNING: QUARTZ IODINE BULBS MUST NOT BE HANDLED IN SERVICE. HANDLING OF BULB WILL CAUSE SURFACE CONTAMINATION WHICH MAY CAUSE BULB TO SHATTER.

- (b) Position a gasket (72-42-01/2-225) on mounting boss and insert the flanged sealing bar (72-42-01/2-220) into engine.
- (c) Position cover plate (72-42-01/2-210) on sealing bar and secure with two bolts, torque-tighten to 100 lbf in. (11,3 N.m).
- (d) Wire-lock bolts together.

E. Install Blanking Covers.

- (1) Assemble the blanking cover to the left-hand inspection port (Ref.Fig.314, detail A).
 - (a) Apply lubricant 'A' to bolts (76-21-01/2-70).
 - (b) Secure the cover (76-21-01/2-80) with six bolts, torque-tighten to 100 lbf in. (11,3 N.m.).
 - (c) Wire-lock bolts together.
- (2) Assemble the blanking cover to the right-hand inspection port (detail B).
 - (a) Apply lubricant 'A' to bolts (72-42-01/2-40).
 - (b) Locate the cover (72-42-01/2-50) on the port with the spacer plate (72-42-01/2-45) on engines to pre-SB.72-62/SB.72-8629-256 standard (detail B) and retain in position with six bolts (72-42-01/2-40B) lightly tightened. Finally torque-tighten bolts to 100 lbf in. (11,3 N.m) to secure cover.
 - (c) Wire-lock bolts together.
- (3) Assemble the blanking cover to the bottom inspection port (detail C).
 - (a) Apply lubricant 'A' to bolts (72-42-01/2-160).

(b) With a gasket (72-42-01/2-175) interposed, position the blanking cover (72-42-01/2-170) on the engine and secure with six bolts, torque-tighten to 100 lbf in. (11,3 N.m).

(c) Wire-lock bolts together.

F. Acceptance Standards - HP Turbine Rotor Blades.

- (1) Carry out the internal examination of the HP turbine blades in conjunction with the engine build records to establish details of the build standard of turbine blades installed during assembly.
- (2) Examine the turbine blades in accordance with the acceptance standards detailed in (3), (4), (5) and (6). All acceptable damage must be smooth contoured, crack free, and not penetrating into the cooling passages.
- (3) Impact damage (Ref.Fig.318).
 - (a) Any damage not contained within zones A, B and C. Reject.
 - (b) Any measurable damage in zone A. Reject.
 - (c) Damage in zone B not more than 0.070 in. (1,780 mm) in diameter and not more than 0.007 in. (0,180 mm) in depth. Accept (subject to acceptance of damage in (d)).
 - (d) Damage in zone C not more than 0.125 in. (3,170 mm) in diameter and not more than 0.010 in. (0,250 mm) in depth. Accept (subject to acceptance of damage in (c)).

To be issued later.

11. Examination of the LP Turbine Rotor Blades and Nozzle Vanes

NOTE: The LP turbine rotor blades leading edges are examined by the use of an optical inspection probe inserted through one of two sealed ports located in the CCOC rearward of the fuel drains tank. The trailing edges of the turbine rotor blades are accessible from the jet pipe.

NOTE: The LP turbine nozzle vanes are examined from the same access points as the rotor blades.

- A. Install the LP Rotating Assembly Turning Equipment (Ref.72-09-01 Engine Turning).

NOTE: If examination of the LP compressor rotor blades has been carried out, the turning equipment will be assembled.

- B. Prepare the LP Turbine Rotor Blades and Nozzle Vanes for Examination (Ref.Fig.317).

- (1) Remove the flanged sealing bar from the CCOC.

(a) Remove the bolts securing the cover plate and the flanged sealing bar and detach the cover plate.

(b) Withdraw the flanged sealing bar from the engine.

(i) On pre SB.72-58 standard engines, remove any deposits of jointing compound from abutment surfaces.

(ii) On SB.72-58 standard engines, remove the gasket.

- (2) Ensure that the optical inspection equipment (light source box (Tool 1888) and cable (Tool 1891)) have been prepared and tested (Ref.para.4.A).

- C. Examine the Rotor Blades and the Nozzle Vanes.

CAUTION: DO NOT MOVE LIGHT SOURCE BOX WHILE SWITCHED ON OR WITHIN 30 SECONDS OF SWITCHING OFF.
BULB FILAMENT IS NOT SHOCK RESISTANT WHEN HOT.

- (1) Commence examination using the probe (Tool 1892) in conjunction with the light source box (Tool 1888) and cable (Tool 1891).

(a) Insert the probe and ensure free penetration.

NOTE: The protective sleeve (Tool 1893) must be retained on the probe at all times except when removal is essential for insertion of the probe or its effective use when inserted.

- (b) Switch on the probe illumination and commence examination.

NOTE: There are 79 LP turbine rotor blades per set.

- (c) Carefully examine the leading edge region of the turbine rotor blades for damage, signs of blockage or evidence of debris wrapped around the leading edges. Turn the engine changing the probe position and varying the depth of insertion as necessary to obtain coverage.
 - (d) Record the extent of any damage or debris found for comparison with the acceptance limits given in para.E. If a photographic record of the damage is required, use the equipment and procedures detailed in 72-09-04 Inspection/check, or equivalent.
 - (e) Examine the LP nozzle vanes as far as possible for signs of damage.
- (2) On completion of examination switch off the illumination and withdraw the probe.
 - (3) Dismantle and stow the optical inspection equipment (Ref.para.5.A).
 - (4) Continue the examination by obtaining access through the exhaust diffuser. Turn the engine as necessary to ensure full coverage of the surfaces to be examined and record the extent of any damage found for comparison with the acceptance limits given in para.E.
 - (a) Carry out a visual and tactile examination of the trailing edge region of turbine rotor blades for signs of damage.
 - (b) Carry out a visual and tactile examination of the turbine nozzle vanes for signs of damage.
 - (5) Remove the hand turning equipment (Ref.72-09-01 Engine Turning).

D. Install the Flanged Sealing Bar Assembly (Ref.Fig.317).

- (1) Apply lubricant 'A' to the bolts (72-42-01/2-200).
- (2) On pre SB.72-58 standard engines, apply jointing compound 'A' to abutment surfaces and insert flanged sealing bar (72-42-01/2-220) into the engine.
- (3) On SB.72-58 standard engines, position a gasket (72-42-01/2-225) on mounting boss and insert the flanged sealing bar (72-42-01/2-220) into engine.
- (4) Position cover plate (72-42-01/2-210) on sealing bar and secure with two bolts, torque-tighten to 100 lbf in. (11,3 N.m).
- (5) Wire-lock the bolts together.

E. Acceptance Standards - LP Turbine Rotor Blades.

- (1) Carry out the internal examination of the LP turbine blades in conjunction with the engine build records to establish details of the build standard of turbine blades installed during assembly.
- (2) Examine the turbine blades in accordance with the acceptance standards detailed in (3) to (9). All acceptable damage which affects not more than five blades must be smooth contoured, crack free, and not penetrating into the cooling passages.
- (3) Impact damage (Ref.Fig.319).
 - (a) Damage in zone A not more than 0.080 in. (2 mm) in diameter and not more than 0.010 in. (0,250 mm) in depth and not less than 0.750 in. (19 mm) between damage marks. Accept (subject to acceptance of damage in (b) and (c)).
 - (b) Damage in zone B not more than 0.125 in. (3,170 mm) in diameter and not more than 0.015 in. (0,380 mm) in depth and not less than 0.250 in. (6,35 mm) between damage marks. Accept (subject to acceptance of damage in (a) and (c)).

ENGINE INTERNAL EXAMINATION - USE OF PHOTOGRAPHIC EQUIPMENT1. General

To obtain permanent records of engine internal damage, photographic equipment is used in conjunction with internal inspection procedures using the optical inspection probes (Ref.72-09-03 Inspection/Check).

NOTE: Functional details of the camera, film loading and unloading are contained in the camera manufacturers information provided with the camera.

2. Tools and Equipment

Adapter (Tool 1905) PE.15957

Camera assembly comprising:

Case (Tool 1904) PE.28892

Camera body (Tool 1903)... .. PE.15953

Screen, clear PE.15954

Lens (Tool 1906) PE.15956

Viewfinder (Tool 1908) PE.15958

Cable release (Tool 1909) PE.15979

Tripod stand (Tool 1907) PE.15960

Photographic film:

HP4 (Black and white) (or ASA 408-650, DIN.27-29 equivalent)

3. Prepare Photographic Equipment (Ref. Fig.301)

A. Prepare the Camera.

- (1) Remove the camera (Tool 1903) from its case (Tool 1904) and check that all attachments are securely assembled to the body.
- (2) Assemble the adapter (Tool 1905) to the camera by screwing adapter into the camera lens (Tool 1906) filter thread and lightly tighten by hand.

- (3) Load the camera with film.
 - (4) Set the camera controls as follows:
 - (a) Set the aperture to max. (f2.8).
 - (b) Set the aperture to 'M' (manual).
 - (c) Set the focusing distance to 3.5 feet (1,067 m).
 - (d) Wind adhesive tape around the body of the lens, to lock the adjustments together and prevent accidental movement.
 - (e) Set the shutter speed control to obtain the following exposure times:

HP compressor blades	...	1 second
LP compressor blades	...	2 seconds
Turbine blades	...	2 seconds
Combustion chamber...	...	2 to 3 seconds
 - (5) Assemble and secure camera to the tripod stand (Tool 1907).
 - (6) Position the tripod near area of operation on a firm flat surface.
- B. Connect the Camera to the Intrascope Probe.
- (1) Hold the probe in position throughout the photographic procedure.
 - (2) Remove the probe eye-piece (Tool 1889) from the probe.
 - (3) Position the camera to effect alignment of the adapter (Tool 1905) with the probe. Adjust the pan and tilt head to ensure that the adapter axis is exactly in line with the intrascope axis.
 - (4) Secure the probe to the adapter with adhesive tape.
 - (5) Check through the camera viewfinder (Tool 1908), that the area to be photographed is in view, and if necessary, adjust the camera and/or probe.

INSPECTION/CHECK

72-09-04

- (6) Set the probe illumination light source to the maximum setting.
- (7) Ensure that there is no movement of the engine or camera and operate the camera shutter release (Tool 1909).
- (8) Record the film frame numbers and identify each frame with the area photographed.
- (9) Take the second photograph of the damage area with one and a half to twice the specified exposure time to allow for variations in light intensity.

4. Dismantle the Photographic Equipment.

NOTE: On completion of recording engine internal damage, disconnect and dismantle the camera equipment.

A. Disconnect the Camera from the Intrascopes Probe.

- (1) Remove the adhesive tape and detach the camera from the probe ensuring that the probe does not fall free from the engine.
- (2) Remove the equipment from the vicinity of the engine or transfer to the next area to be photographed.

B. Dismantle the Camera.

- (1) Remove the camera from the tripod.
- (2) Remove the film from the camera.
- (3) Remove the adapter from the camera lens filter thread.
- (4) Remove the adhesive tape used to lock the adjustments and place the camera in the carrying case (Tool 1904).
- (5) Submit the film for development, together with a copy of the frame sequence/damage area identification record. Instruct that the negatives and prints are identified accordingly and printed 6 in. by 4 in. (150 mm by 100 mm).

AIR INLET SECTION - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 302, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Table 301.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

There is no requirement for magnetic particle crack detection applicable to this Topic.

5. Flange (303-40)

A. Inspect Flange Abutment Faces.

- (1) Nicks, burrs and scores.

Accept after repair
providing sealing
capabilities are
unimpaired.

- (2) Wear.

- (a) Not more than 5 per
cent reduction in
flange thickness.

Accept if compat-
ibility is
preserved.

- (b) Bolt-holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

- (c) Fretting at D-head bolt
traps not more than
0.001 in. (0,030 mm)
in depth.

Accept after
repair.

6. Baffle Assembly (303-60)

A. Inspect Threaded Inserts and Shank Nuts (Ref.72-09-00 Inspection/Check).

B. Inspect Baffle and Flange Abutment Flanges.

(1) Nicks, burrs and scores.

Accept after repair
providing sealing
capabilities are
unimpaired.

(2) Wear.

(a) Not more than 5 per
cent reduction in
flange thickness.

Accept if compat-
ibility is
preserved.

(b) Bolt-holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

C. Inspect Oil Feed and Oil Scavenge Tube Locations.

(1) Fretting.

(a) Not more than 0.001 in.
(0,030 mm) in depth is
acceptable.

Accept after repair
providing repair
maintains profile.

D. Inspect Weld Joints.

(1) Visual check for obvious cracking outside crack
detection checks.

(a) Any cracking.

Reject.

E. Inspect Baffle Assembly.

(1) Dents.

- (a) Minor dents of smooth contour.

Accept after repair providing repair does not induce cracking.

7. Baffle (303-110)

A. Inspect Baffle Assembly and Front Bearing Support Abutment Flange.

(1) Nicks, burrs and scores.

Accept after repair providing sealing capabilities are unimpaired.

(2) Wear.

- (a) Not more than 5 per cent reduction in flange thickness.

Accept if compatibility is preserved.

- (b) Bolt-holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

(3) Dents.

- (a) Minor dents of smooth contour.

Accept.

8. Flange Assembly (304-10)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Oil Tube Abutment Face.

(1) Nicks and burrs.

Accept after repair providing sealing capabilities are unimpaired.

(2) Scores.

- (a) Not more than 0.002 in.
(0,050 mm) in depth
and not extending across
the space between the
oil inlet holes and the
oil drain groove.

Accept after repair
providing the
sealing capabilities
are unimpaired.

(3) Wear.

- (a) Bolt-holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

C. Inspect Tube Sealing Lands.

(1) Wear.

- (a) Slight witness mark.

Accept after
repair.

D. Inspect Flange Assembly.

(1) Nicks and burrs.

Accept after
repair.

(2) Wear.

- (a) Bolt-holes elongated
not more than 0.030 in.
(0,760 mm).

Accept after
repair.

9. Tube Assembly (304-50)

A. Inspect Tubes (Ref.72-09-00 Inspection/Check).

NOTE: The tube is constructed in such a way that the oil
feed tube is enclosed in the drain tube, any damage
to the outer tube must result in close inspection
of inner tube.

B. Inspect Threads (Ref.72-09-00 Inspection/Check).

C. Inspect Flange Assembly and Oil Tube Abutment Faces.

(1) Nicks and burrs.

Accept after repair
providing sealing
capabilities are
unimpaired.

LP COMPRESSOR FRONT BEARING SUPPORT - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

72-23-01

Page 301

(2) Scoring.

- (a) Not more than 0.003 in.
(0,760 mm) deep.

Accept after
repair providing
sealing
capabilities are
unimpaired.

B. Inspect Transducer Platform.

- (1) Nicks and burrs.

Accept after
repair.

6. Headless Shoulder Pin (302-70)

A. Inspect for Damage.

- (1) Any damage to pins.

Reject.

7. LP Compressor Front Bearing Outer (302-80)

A. Inspect Bearing (Ref.72-09-00 Inspection/Check).

B. Carry Out Dimensional Checks (Ref.72-20-00 Fits and Clearances).

- (1) Check bearing track outer diameter (F.C.S.601-1).

NOTE: Make this check in conjunction with the
Bearing Housing Assembly (para.9).

- (a) Within F.C.S. limits. Accept.

- (2) Check roller bore and inner track diameter
(F.C.S.601-3).

NOTE: Make this check in conjunction with the LP
Compressor Rotor Front Bearing Inner Track
(Ref.72-31-03/302-30).

- (a) Within F.C.S. limits. Accept.

- (3) Check diametrical clearance of bearing (F.C.S.601-7).

NOTE: Make this check in conjunction with the LP
Compressor Rotor Front Bearing Inner Track
(Ref.72-31-03/302-30).

- (a) Within F.C.S. limits. Accept.

F. Inspect Rear Abutment Face.

- (1) Nicks and burrs.

Accept after
repair providing
repair does not
violate F.C.S.601-2
limits.

- (2) Scoring.

- (a) Not more than 0.005 in.
(0,130 mm) in depth.

Accept after
repair providing
repair does not
violate F.C.S.
limits.

- (3) Wear.

- (a) Bolt-holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

G. Inspect Windback Thread Housing.

- (1) Nicks and burrs.

Accept after
repair.

- (2) Any damage outside the limits
in para.(3) and (4).

Accept after
repair (Ref.
72-23-01 Repair
No.1 and No.3).

- (3) Grooving.

- (a) Rubbing extending over an
arc not greater than 90 deg.
and regardless of width
over face, provided that
maximum depth does not
exceed 0.005 in. (0,130 mm)
and that F.C.S. limits are
not violated.

Accept.

- (4) Distortion.

- (a) Provided that minimum local
clearance is not more than
0.006 in. (0,150 mm) below
the minimum permissible
dimension in the F.C.S.

Accept.

H. Inspect Thread in Oil Tube Location (Ref.72-09-00 Inspection/Check).

J. Inspect Seating in Oil Tube Locations.

(1) Fretting.

(a) Not more than 0.002 in.
(0,050 mm) in depth.

Accept after
repair providing
sealing
capabilities are
unimpaired.

K. Inspect General Condition of Bearing Housing.

(1) Nicks and burrs.

Accept after
repair.

L. Inspect Shank Self-locking Nuts.

(1) Inspect nut (Ref.72-09-00 Inspection/Check).

10. Labyrinth Housing (302-140)

A. Carry Out Dimensional Checks (Ref.72-20-00 Fits and Clearances).

(1) Check bearing housing locating diameter (F.C.S.601-2).

NOTE: Make this check in conjunction with the
Bearing Housing Assembly (para.9).

(a) Within F.C.S. limits. Accept.

(2) Check No.2.A. and 2.B. labyrinth housing bores
(F.C.S.601-9).

NOTE: Make this check in conjunction with the
LP Compressor Front Rotor Shaft (Ref.
72-31-03).

(a) Within F.C.S. limits. Accept.

B. Inspect Labyrinth Housing.

(1) Nicks and burrs.

Accept after
repair.

- (2) Any damage outside the limits
in para.(3) and (4).

Accept after
repair (Ref.
72-23-01 Repair
No.2).

- (3) Grooving.

- (a) Any number of grooves,
provided that they are all
contained within an arc not
greater than 60 deg. of bore
mean circumference, that
maximum depth is not greater
than 0.005 in. (0,130 mm)
and that F.C.S. limits are
not violated.

Accept.

- (4) Distortion.

- (a) Provided that minimum local
clearance is not more than
0.006 in. (0,150 mm) below
the minimum permissible
dimension in the F.C.S.

Accept.

C. Inspect Attachment Flange and Bearing Support Locating
Flange.

- (1) Nicks and burrs.

Accept after
repair providing
repair does not
violate F.C.S.
limits.

- (2) Wear and fretting.

- (a) Slight witness mark on
attachment flange.

Accept.

- (b) Bolt-holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

LP COMPRESSOR CASE AND VANES - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

10. Labyrinth Ring (302-190, 303-380, 304-200, 305-400, 306-200, 307-400)

A. Carry Out Dimensional Checks (Ref.72-31-00 Fits and Clearances).

- (1) Check bores of LP 1, 2, 3, 4, 5 and 6 stator labyrinths (F.C.S.601-13/17/21 and 602-32/36/41).

NOTE: Carry out these checks in conjunction with the LP Compressor Rotor Spacer Rings (Ref.72-31-00).

NOTE: Remove any burrs or metal build-up prior to carrying out these checks.

(a) Within F.C.S. limits. Accept.

B. Inspect Labyrinth Ring Housing.

(1) Nicks and burrs. Accept after repair.

(2) Wear.

(a) Damage greater than (b). Accept after repair (Ref.72-31-01 Repair No.1).

(b) Any number of grooves provided that their cumulative length does not exceed 60 degrees of housing mean circumference, that maximum depth is not greater than 0.005 in. (0,130 mm) and that F.C.S. limits are not violated. Accept.

(3) Distortion.

(a) Provided that minimum local clearance is not less than 0.006 in. (0,150 mm) below the minimum permissible dimension in the F.C.S. Accept.

C. Inspect Vane Fixing Ring Location.

(1) Nicks and burrs. Accept after repair.

C. Inspect Captive Nuts (Ref.72-09-00 Inspection/Check).

13. Brackets (308-100/430/490, 309-30/60/110/140/180/190/200/230/270/300/320/360/410/420/460/500/530/560/590, 310-96/180/210/220/230/270/280/330/340/380/410)

A. Inspect Attachment Faces.

(1) Wear.

(a) Reduction of material thickness not more than 10 per cent.

Accept.

(b) Bolt-holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

(2) Scoring.

(a) Not more than 0.010 in. (0,250 mm) in depth.

Accept after repair providing material thickness is not reduced by more than 10 per cent.

B. Inspect Bracket.

(1) Nicks and burrs.

Accept after repair.

(2) Distortion.

Accept after repair to restore profile provided repair does not induce cracking and compatibility is preserved.

14. Flanged Connector (308-320)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Tube Sealing Locations.

(1) Nicks and burrs.

Accept after repair providing sealing capabilities are unimpaired.

OVERHAUL

LP COMPRESSOR EXIT GUIDE CASE AND VANES - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

TEMPORARY
REVISION**

British airways

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No.0-2

Dennis Howard

For Chief Technical and Industrial Services Engineer CAA Design Approval No.DAI/8566/78

TEMPORARY REVISION NO.72-565

Insert in 72-31-02 after page 302

REASON FOR ISSUE

To add a BEOL procedure following Table 301

ACTION

(3) BEOL PROCEDURE

The following process may be used in lieu of process MPL specified in Table 301.

Equipment and Materials

- (a) Magnaflux Model X2152 Pancake Coil and Knife Switch Unit.
- (b) Magnaflux TAQ 1205 three phase full wave rectified power supply connected to (a) by twin cables.
- (c) Ardrox Type 851-3 ink containing 0.3 to 0.3% fluorescent magnetic particle inspection powder.

Procedure.

Exit Guide Vane Case Fig. No. 302 Item No. 150 can be crack detected using the following method:-

- (a) Demagnetise
- (b) Magnetise using knife switch 3000A. Case must be rotated through coil.
- (c) Apply ink on residual techniques.
- (d) Inspect under U.V. light.
- (e) Demagnetise
- (f) Magnetise using pancake coil 2800 A.
- (g) Apply ink on residual techniques.
- (h) Inspect under U.V. light.
- (i) Demagnetise.

OVERHAUL

LP COMPRESSOR ROTOR INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.
- F. Certain types of blade damage can be repaired in-situ, without dismantling the engine. For details of in-situ blade blending and acceptance limits refer to 72-09-31 LP and HP Compressor Rotor Blades - Repair by In-situ Blending.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards. Special attention must be paid to critical areas of certain specified items during inspection. An instruction to this effect is included in the inspection detailed for the specified item.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.
- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
 - (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS

B. Fluorescent Dye Crack Detection.

- (1) Submit the items listed in Table 302 to crack detection in accordance with the process quoted. For details of the processes, refer to 72-09-00 Inspection/Check.

Items marked with an asterisk (*) in Table 302 feature defined critical areas. (Ref. Figs.307 and 308). In addition to the general overall crack detection examination, special attention must also be paid to those defined critical areas during the inspection.

CAUTION: THIS IS A ROTATING ASSEMBLY. ENSURE THAT ANY FREE OR CAPTIVE SELF-LOCKING NUTS (REGARDLESS OF SIZE) HAVE BEEN REPLACED BEFORE THE ASSEMBLY IS RELEASED FOR SERVICE (REF.72-09-00 INSPECTION/CHECK). FAILURE TO DO SO MAY RESULT IN ENGINE DAMAGE.

NOTE: Inspect all balancing bolts (302-80/140/230/320, 303-310), balancing weights (302-60/120/210/300, 302-290) or washers for general condition. Reject any damaged items; any attempt at repair will render them suspect for balancing purposes. Retain any undamaged items for possible selection and use during assembly.

4. Shaft Cover (302-20)

A. Inspect Front Shaft Cover.

(1) Nicks and burrs. Accept after repair.

B. Inspect Abutment Face.

(1) Fretting.

(a) Not more than 0.002 in.
(0,050 mm) in depth. Accept after repair.

(2) Scoring.

(a) Not more than 0.005 in.
(0,130 mm) in depth. Accept after repair.

5. LP Compressor Rotor Front Bearing Inner Track (302-30)

- A. Carry Out Dimensional Checks (Ref.72-31-00 Fits and Clearances).

NOTE: Carry out these checks in conjunction with the Front Rotor Shaft (302-90), the Front Bearing 72-23-01/302-80 and the Front Bearing Support 72-23-01/302-110.

- (1) Check inner track bore (F.C.S.601-6).

(a) Within F.C.S. limits Accept.

- (2) Check bearing diametrical clearance (F.C.S.601-7).

(a) Within F.C.S. limits. Accept.

- B. Inspect Bearing Track (Ref.72-09-00 Inspection/Check).

6. Front Rotor Shaft Assembly (302-90)

- A. Carry Out Dimensional Checks (Ref.72-31-00 Fits and Clearances).

- (1) Check bearing inner track locating diameter (F.C.S.601-6).

NOTE: Make this check in conjunction with the LP Compressor Rotor Front Bearing Inner Track (para.5).

(a) Within F.C.S. limits. Accept.

- (2) Check diameter of No.1 windback seal (F.C.S.601-8).

NOTE: Make this check in conjunction with the LP Compressor Rotor Front Bearing Housing (Ref.72-23-01).

(a) Within F.C.S. limits. Accept.

- (3) Check diameter of Nos.2A and 2B labyrinth seals (F.C.S.601-9).

NOTE: Make this check in conjunction with the LP Compressor Rotor Front Bearing Labyrinth Housing (Ref.72-23-01).

- (4) Check bolt locating land bores (F.C.S.601-10).

NOTE: Make this check in conjunction with the
Externally Relieved Body Bolts (para.11).

B. Inspect Windback Thread.

- (1) Rubbing.

- (a) Slight rubbing within
F.C.S. limits.

Accept.

- (2) Nicks and burrs.

Accept after
repair.

- (3) Minor edge damage.

Accept after repair
providing that only
one blend is made
to each fin, that
finished blends
are not more than
one-half fin depth
deep or five times
fin depth long,
that all blends on
adjacent blades are
separated radially
by not less than
five times fin
depth at their
ends, and that
F.C.S. limits are
not violated.

NOTE: Greater damage will require repair
(Ref.72-31-03 Repair No.2).

C. Inspect Nos.2A and 2B Labyrinth Fins.

- (1) Rubbing.

- (a) Slight rubbing within
F.C.S. limits.

Accept.

- (2) Nicks and burrs.

Accept after
repair.

(3) Minor edge damage.

Accept after repair providing that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that all blends on adjacent blades are separated radially by not less than five times fin depth at their ends, and that F.C.S. limits are not violated.

NOTE: Greater damage will require repair
(Ref.72-31-03 Repair No.2).

D. Inspect Bearing Inner Track Location.

(1) Nicks and burrs.

Accept after repair.

(2) Scoring.

(a) Not more than 0.005 in.
(0,130 mm) in depth.

Accept after repair
(Ref.72-31-03
Repair No.3).

E. Inspect Main Abutment Face.

(1) Nicks and burrs.

Accept after repair.

(2) Scoring.

(a) Not more than 0.005 in.
(0,130 mm) in depth.

Accept after repair.

INSPECTION/CHECK

72-31-03

Page 309

Apr 1/77

OVERHAUL

F. Inspect Shoulder Bolt Holes.

(1) Nicks.

- (a) Not more than 0.010 in.
(0,250 mm) deep.

Accept after repair
providing repair
does not violate
F.C.S. limits.

(2) Scoring.

- (a) Any scoring.

Reject.

7. Shanked Self-Locking Nuts (302-100)

A. Inspect Self-locking Nuts (Ref.72-09-00 Inspection/Check).

NOTE: Ensure that all self-locking shanked nuts have
been removed/renewed.

8. LP Compressor Blades (302-150/240/330, 303-40/100/160, 304-320)

A. Inspect Blade Fir-tree Form and Abutment Faces (Ref.
Fig.305).

(1) Fretting.

- (a) Any fretting on the
loaded flanks that just
produces a step between
the fretted and non-
fretted surfaces at the
ends of the inner surfaces.

Reject.

NOTE: Where there is visible fretting, the step
may be detected by traversing a 0.040 in.
(1,00 mm) scribe or similar instrument
over the fretted and non-fretted
surfaces.

- (b) Not more than 0.003 in.
(0,080 mm) in depth on
the abutment faces.

Accept after
repair.

- (c) Not more than 0.005 in.
(0,130 mm) in depth on
blade tang outer face on
stage 1 and 2.

Accept.

OVERHAUL

(2) Nicks and burrs.

Accept after
repair.

B. Inspect Blade Aerofoil.

(1) Inspect to acceptance and blending standard (Ref. 72-31-03 Repair No.6).

C. Inspect Stages 1 to 4 for Excessive Blade Twist (302-150/240/330, 303-40) (Ref.Fig.306).

(1) Position Inspection Fixture (Ref.3142) base plate on surface table (refer to 72-31-03 Special Tools).

CAUTION: ENSURE PLUNGER SPRINGS ARE LOCATED ON PLUNGER SHAFTS.

(2) Locate 4 plungers in relevant stage location holes in fixture (2 at blade tip position and 2 at blade centre position).

(3) Position blade location block for required stage ensuring the block locators are positioned in the correct base plate slots. Secure using the 4 Allen screws.

(4) Position calibration block for required stage at blade tip position and secure using thumb screw.

(5) Position blade root in blade location block depressing the 4 plungers beneath aerofoil face as blade enters block. Clamp in position.

CAUTION: ENSURE ROOT HAS COMPLETELY ENTERED CLAMP AND ROOT LUG IS TIGHT AGAINST CLAMP TOP FACE.

(6) Starting at blade tip position and using suitable measuring equipment, measure the distance between plunger at trailing edge position and calibration block. Record dimension.

(7) Also at blade tip position, measure the distance between plunger at leading edge position and calibration block. Record dimension.

(8) Subtract the lower of the two dimensions recorded at paras.(6) and (7) from the higher. Using the Inspection Fixture data plate; if the difference between the dimensions equates to 2° or below continue to next step of inspection procedure, if difference equates to above 2° reject blade.

(2) Nicks and burrs.

- (a) Small nicks and burrs on
fir-tree edges and radii.

Accept after repair
providing repair
maintains profile
of radii.

B. Carry Out Dimensional Check (Ref.72-31-00 Fits and Clearances).

- (1) Check bolt locating land bores in stages 1 to 7 disks inclusive (F.C.S.601-11/15/19/23 and 602-34/38/43).

NOTE: Make these checks in conjunction with the
Externally Relieved Body Bolts (para.11).

- (a) Within F.C.S. Limits.

Accept.

C. Inspect Retaining Bolt Bores.

CAUTION: THE DISC BOLT HOLE BORE IS A CRITICAL AREA.
(REF. FIG.307). SPECIAL ATTENTION MUST BE PAID
TO THIS AREA FOR SIGNS OF DAMAGE DURING THE
GENERAL OVERALL INSPECTION.

- (1) Scoring.

- (a) Any scores.

Reject.

- (2) Wear.

- (a) Slight wear within
F.C.S. limits.

Accept.

D. Inspect Abutment Faces.

- (1) Light witness marks.

Accept.

- (2) Nicks and burrs.

Accept after
repair.

- (3) Scoring.

- (a) Any scores.

Reject.

(3) Minor edge damage.

Accept after repair providing that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that all blends on adjacent fins are separated radially by not less than five times fin depth at their ends, and that F.C.S. limits are not violated.

NOTE: Greater damage will require repair (Ref.72-31-03 Repair No.4 and No.5).

C. Inspect Bolt Hole Locations.

CAUTION: THE SPACER RING BOLT HOLE BORE IS A CRITICAL AREA. (REF. FIG.308). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

(1) Scoring.

- | | |
|---------------------------------------|---------|
| (a) Any scores. | Reject. |
| (b) Slight wear within F.C.S. limits. | Accept. |

D. Inspect Abutment Faces.

(1) Wear.

- | | |
|--------------------------|---------|
| (a) Light witness marks. | Accept. |
|--------------------------|---------|

(2) Nicks and burrs.	Accept after repair.
----------------------	----------------------

(3) Scoring.

- | | |
|---|----------------------|
| (a) Not more than 0.005 in. (0,130 mm). | Accept after repair. |
|---|----------------------|

OVERHAUL

- E. Inspect Rotor Blade Retaining Flanges, Stages 1 to 2 and Stages 2 to 3.

(1) Fretting.

- (a) Not more than 0.005 in. Accept.
(0,130 mm) in depth at
the rotor blade tang
location.

- (2) Nicks and burrs. Accept after
repair.

11. Bolts, Externally Relieved Body (302-170/260, 303-10/70/130,
304-250/310)

- A. Carry Out Dimensional Checks (Ref.72-31-00 Fits and Clearances).

- (1) Check location land diameters of all bolts as follows:

Bolt Identity	F.C.S. Ref.
302-170	601-10/11/12
302-260	601-14/15/16
303-10	601-18/19/20
303-70	601-22/23/24
303-130	602-33/34/35
304-250	602-37/38/39/40
304-310	602-42/43

NOTE: Carry out these checks in conjunction with the Front Rotor Shaft (para.6), Compressor Disks (para.9), Spacer Rings (para.10) and Rear Rotor Shaft (para.20).

- (a) Within F.C.S. limits. Accept.

- B. Inspect Bolt.

- (1) Nicks and burrs. Accept after repair
providing repair
does not violate
F.C.S. limits.

- C. Inspect Threads (Ref.72-09-00 Inspection/Check).

12. Retaining Nut (304-10) and Plain Round Nut (304-50)
- A. Inspect Threads (Ref.72-09-00 Inspection/Check).
 - B. Inspect Retaining Nut.
 - (1) Nicks and burrs. Accept after repair.
 - C. Inspect Spanner Locations.
 - (1) Damage.
 - (a) Any damage that may affect tool operation or safety. Reject.
 - (b) Any other minor damage. Accept.
 - D. Inspect Silver Plating.
 - (1) Damage or wear. Reject for re-plating (Ref. 72-09-08, Repair).
13. Cupwasher Locking (304-20)
- A. Inspect Cupwasher (Ref.72-09-00 Inspection/Check).
14. Operating Probe Ring (304-40)
- A. Inspect Probe Ring.
 - (1) Nicks and burrs. Accept after repair.
 - (2) Wear.
 - (a) Not more than 0.005 in. (0,130 mm) of wear in the knocker groove. Accept after repair.

NOTE: The manufactured width of the knocker groove is between 0.220 and 0.230 in. (5,588 and 5,842 mm).
 - B. Check Headless Pins.
 - (1) Nicks and burrs. Reject.
 - (2) Security.
 - (a) Pins firm in location. Accept.

15. Pinned Locking Washer (304-60)

A. Check Locking Washer (Ref.72-09-00 Inspection/Check).

16. Adjusting Washer (304-70 to 165 selective range)

NOTE: This item may require selection during assembly.

A. Inspect Abutment Faces.

(1) Nicks, burrs and scores.

Accept, provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

(2) Fretting and wear.

Reject.

17. Sleeve Housing (304-190)

A. Carry Out Dimensional Checks (Ref.72-31-00 Fits and Clearances).

(1) Check square dimensions of splines (Ref.72-09-00 Inspection/Check) (F.C.S.602-53).

NOTE: Make this check in conjunction with the LP Signal Shaft Serrated Sleeve (Ref.72-31-04).

NOTE: This item contains 35 splines pitched as for 36, with one uncut at master spline.

(a) Any side of square outside F.C.S. limits.

Reject.

(b) Within F.C.S. limits.

Accept.

B. Inspect Spline (Ref.72-09-00 Inspection/Check).

(1) Nicks and burrs.

Accept after repair.

(2) Light chatter not more than 0.002 in. (0,050 mm) in depth.

Accept after repair

C. Inspect Sleeve Housing.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
 - (a) Slight witness marks on abutment face. Accept.
 - (b) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

D. Inspect Metaflex Seal Location.

- (1) Nicks and burrs.
 - (a) Small peripheral nicks and burrs. Accept after repair.
- (2) Scores.
 - (a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair.

E. Inspect External Finish (Ref.72-09-04 Repair for Areas with External Finish and the Procedure for Application of Finish).

NOTE: To enable the crack detection (magnetic particle) to be carried out, the high heat resisting aluminium enamel finish will have been removed during cleaning.

18. Metaflex Seal (304-210)

A. Inspect Metaflex Seal (Ref.72-09-00 Inspection/Check).

19. Spherical Centre Mounting (304-220)

A. Carry Out Dimensional Check (Ref.72-31-00 Fits and Clearances).

- (1) Check square dimensions of splines (Ref.72-09-00 Inspection/Check) (F.C.S.602-55).

NOTE: Make this check in conjunction with the LP Signal Shaft Locking Sleeve (Ref.72-31-04).

NOTE: This item contains 35 splines pitched as for 36, with one uncut at master spline.

- (a) Any side of square outside F.C.S. limits. Reject.
- (b) Within F.C.S. limits. Accept.

B. Inspect Spline (Ref.72-09-00 Inspection/Check).

- | | |
|--|----------------------|
| (1) Nicks and burrs. | Accept after repair. |
| (2) Light chatter not more than 0.002 in. (0,050 mm) in depth. | Accept after repair. |

C. Inspect LP Shaft Bearing Surface.

- | | |
|--|----------------------|
| (1) Wear. | |
| (a) Not more than 0.002 in. (0,050 mm) in depth. | Accept after repair. |
| (2) Nicks and burrs. | Accept after repair. |

D. Inspect Rear Rotor Shaft Abutment Face.

- | | |
|--|----------------------|
| (1) Wear. | |
| (a) Not more than 0.002 in. (0,050 mm) in depth. | Accept after repair. |
| (2) Nicks and burrs. | Accept after repair. |

20. Rear Rotor Shaft Assembly (304-230)

A. Carry Out Dimensional Checks (Ref.72-31-00 Fits and Clearances).

- (1) Check bolt location bores (F.C.S.602-39).

NOTE: Make this check in conjunction with the Externally Relieved Body Bolts (para.11).

- | | |
|---------------------------|---------|
| (a) Within F.C.S. limits. | Accept. |
|---------------------------|---------|

- (2) Check the following seal fins diameters:

No.3 labyrinth (F.C.S.602-45/46/47)

No.4 labyrinth (F.C.S.602-48)

No.5 windback (F.C.S.602-49/50)

NOTE: Make these checks in conjunction with the Intermediate Casing Labyrinth Housings (Ref.72-32-00).

D. Inspect Bearing Journal.

(1) Wear.

(a) Fretting within F.C.S. limits.	Accept after repair.
------------------------------------	----------------------

(2) Scores.

(a) Light localised scratches not more than 0.001 in. (0,030 mm) in depth.	Accept after repair.
--	----------------------

(3) Nicks and burrs.

(a) Nicks and burrs on unmachined surfaces.	Accept after repair.
---	----------------------

E. Inspect Windback Threads and Labyrinths Fins.

(1) Rubbing.

(a) Slight rubbing within F.C.S. limits.	Accept.
--	---------

(2) Nicks and burrs.

Accept after repair.

(3) Minor edge damage.

Accept after repair providing that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that all blends on adjacent blades are separated radially by not less than five times fin depth at their ends, and that F.C.S. limits are not violated.

NOTE: Greater damage will require repair (Ref.72-31-03 Repair No.1).

F. Inspect Attachment Faces.

- (1) Nicks and burrs. Accept after repair.
- (2) Scoring.
 - (a) Light localised scratches not more than 0.002 in. (0,050 mm) in depth. Accept after repair.
- (3) Wear.
 - (a) Light witness mark. Accept.

G. Inspect Bolt Location Holes.

CAUTION: THE REAR ROTOR SHAFT BOLT HOLE BORE IS A CRITICAL AREA. (REF. FIG.309). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION. REFER TO PARAGRAPH 20.N.(2) FOR CORROSION ACCEPTANCE LIMITS.

- (1) Within F.C.S. limits. Accept.

H. Inspect Headless Pins.

- (1) Pins firm in location and free of damage. Accept.

J. Inspect Shank Self-locking Nuts (Ref.72-09-00 Inspection/Check).

NOTE: Ensure that all self-locking shanked nuts have been removed/renewed.

K. Check Metaflex Seal Location.

- (1) Nicks and burrs.
 - (a) Small peripheral nicks and burrs. Accept after repair.
- (2) Scoring.
 - (a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair.

L. Inspect Spherical Centre Mounting Abutment Face.

(1) Nicks and burrs. Accept after repair.

(2) Wear.

(a) Not more than 0.002 in. Accept after
(0,050 mm) in depth. repair.

M. Inspect External Finish (Ref.72-09-04 Repair for areas with external finish and the procedure for application of finish).

NOTE: To enable the crack detection (magnetic particle) to be carried out, the high heat resisting aluminium enamel finish will have been removed during cleaning.

N. Inspect for Corrosion.

NOTE 1: For measurement of corrosion pit depth by replication, refer to 72-09-00 para.19; check that the mixture is free of air bubbles.

NOTE 2: In all cases where corrosion damage is accepted, it is essential that before re-applying any protective coating, all corrosion must be neutralised in accordance with Cleaning, 72-09-00, Process H.

(1) Corrosion terms.

- (a) Superficial - light corrosion or rusting over the whole or part of the component surface. The corrosion is easily removed by light abrasion without loss of dimension, and after removal no pitting is visible to the naked eye.
- (b) Light surface - corrosion slightly more extensive than superficial, where powdery deposits may be seen and after cleaning the surface has become visibly roughened; the depth of roughening will generally be less than 0.002 in. (0,05 mm). Discrete pits are not evident and the depth or degree of corrosion is not readily measureable using the replication technique.

(c) Pitting corrosion.

- (i) Small individual pits typically up to 0.005 in. (0,127 mm) in depth and approx. 0.005 in. (0,127 mm) in diameter. The pits may be in groups, but where necessary, the minimum distance between the outer edges of the pits together with the maximum pit size will be specified for individual areas under consideration.
- (ii) Pitting up to 0.005 in. (0,127 mm) in depth and typically 0.005 in. (0,127 mm) in diameter where individual pits have merged together in small areas/clusters. Acceptable pit depths together with permissible extent of the surface degradation and size of the area where corrosion pits have merged will be specified for individual areas under consideration.

(2) Bolt holes including chamfers.

- (a) Isolated pits or clusters as detailed in (1)(c)(ii), but up to 0.004 in. (0,10 mm) deep-measured depth and covering up to 50% of the surface area. Accept.
- (b) Corrosion greater than that quoted in (a). Reject.

(3) Splines.

- (a) Superficial and light corrosion as detailed in (1)(a) and (b). Accept.
- (b) Corrosion greater than that quoted. Quarantine and seek advice from Rolls-Royce.

OVERHAULLP COMPRESSOR DRIVE SHAFT - INSPECTION/CHECK1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards. Special attention must be paid to critical areas of certain specified items during inspection. An instruction to this effect is included in the inspection detailed for the specified item.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

Items marked with an asterisk (*) in Table 301 feature defined critical areas. (Ref. Figs.304 and 305). In addition to the general overall crack detection examination, special attention must also be paid to those defined critical areas during the inspection.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS

CAUTION: THIS IS A ROTATING ASSEMBLY. ENSURE THAT ANY FREE OR CAPTIVE SELF-LOCKING NUTS (REGARDLESS OF SIZE) HAVE BEEN REPLACED BEFORE THE ASSEMBLY IS RELEASED FOR SERVICE (REF.72-09-00 INSPECTION/CHECK). FAILURE TO DO SO MAY RESULT IN ENGINE DAMAGE.

NOTE: Inspect all balancing bolts (302-50), balancing weights (302-20) or washers for general condition. Reject any damaged items; any attempt at repair will render them suspect for balancing purposes. Retain any undamaged items for possible selection and use during assembly.

4. Outer Sealing Ring (302-70)

- A. Carry Out Dimensional Check (Ref.72-31-04 Fits and Clearances F.C.S.602-161).

NOTE: Carry out this check in conjunction with the Inner Sealing Ring (Ref.72-33-02).

- B. Inspect Outer Sealing Ring.

- | | |
|---|----------------------|
| (1) Nicks, burrs and scores. | Accept after repair. |
| (2) Rubbing. | |
| (a) Not more than 0.005 in. (0,130 mm) over an arc not greater than 90 degrees. | Accept after repair. |
| (3) Wear. | |
| (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm). | Accept after repair. |

5. Retaining Plate (302-100/180)

A. Inspect Retaining Plate.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
 - (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.
- (3) Distortion.
 - (a) Any distortion. Reject.

6. Stiffening Disk Sub-assembly (302-190)

A. Carry Out Dimensional Checks (Ref 72-31-04 Fits and Clearances F.C.S. 601-75).

B. Inspect Stiffening Disks.

- (1) Nicks and burrs.
 - (a) Not more than 0.002 in. (0,050 mm) deep on the locating diameter faces. Accept after repair.
- (2) Distortion.
 - (a) Any distortion. Reject.
- (3) Wear.
 - (a) Not more than 0.005 in. (0,130 mm) of wear on the locating diameter faces. Accept.

C. Inspect Stiffening Disk Tube (Ref.72-09-00 Inspection/Check).

- (1) Wear.
 - (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

INSPECTION/CHECK

72-31-04

Page 305

Sep 1/81

- D. Inspect External Finish (Ref.72-09-04 Repair for Areas with External Finish and the Procedure for Application of Finish).

NOTE: To enable the crack detection (fluorescent dye) to be carried out, the high heat resisting aluminium enamel finish will have been removed during cleaning.

7. Carbon Bearings (302-200)

NOTE: These bearings are to be inspected in situ, carbon bearings that have been disassembled must be discarded.

A. Inspect Carbon Bearings.

(1) Cracks.

(a) Any sign of cracks. Reject.

(2) Scores.

(a) Not more than 0.010 in.
(0,250 mm) in depth. Accept providing 75 per cent of bearing surface is preserved.

(3) Dimension check.

(a) Within F.C.S. limits Accept.

NOTE: Make this check in conjunction with the LP Shaft signal tube assembly (303-190).

8. LP Compressor Drive Shaft Front (302-210)

A. Carry Out Dimensional Checks (Ref.72-31-04 Fits and Clearances).

- (1) Carry out "square" check (Ref.72-09-00 Inspection/Check) on locking sleeve locating serrations (F.C.S. 601-57) and rotor shaft rear locating serrations (F.C.S.601-64).

NOTE: Make these checks in conjunction with the Locking Sleeve (303-160) and LP Compressor Rotor Shaft Rear (Ref.72-31-03).

NOTE: This item contains 35 internal splines pitched as for 36, with one uncut at master spline and 47 external splines, pitched as for 48, with one removed at master slot.

(a) Any side of square out-side F.C.S. limits. Reject.

OLYMPUS 593

MK.610-14-28
OVERHAUL

(b) Within F.C.S. limits. Accept.

- (2) Check diameter of No.9A and 9B labyrinth seal fins (F.C.S.601-58/59).

NOTE: Make this check in conjunction with the Intermediate Case Static Seal Housing Ring (Ref.72-32-00).

(a) Within F.C.S. limits. Accept.

B. Inspect External Splines (Ref.72-09-00 Inspection/Check).

- (1) Nicks and burrs.

(a) Any nicks and burrs not more than 0.003 in. (0,080 mm) in depth and which are located in the lower 50 per cent of any spline. Accept.

(b) Nicks and burrs not more than 0.010 in. (0,250 mm) in depth which are not located in the lower 50 per cent of any spline. Accept after repair providing F.C.S. limits are preserved.

- (2) Wear.

(a) Light witness marks. Accept.

(b) Not more than 0.002 in. (0,050 mm) difference in the width of the spline crests between the front or rear ends of the spline and the mid-point of the spline. Accept.

C. Inspect Internal Splines (Ref.72-09-00 Inspection/Check).

- (1) Nicks and burrs.

(a) Not more than 0.005 in. (0,130 mm) in depth. Accept after repair providing F.C.S. limits are preserved.

D. Inspect Centre Spherical Mounting Locating Lugs.

- (1) Nicks and burrs.

(a) Not more than 0.005 in. (0,130 mm) in depth. Accept after repair.

INSPECTION/CHECK

72-31-04

OLYMPUS 593

MK.610-14-28
OVERHAUL

(2) Wear.

- (a) Not more than 0.002 in.
(0,050 mm) in depth on
the Spherical Centre
Mounting bearing surfaces.

Accept after
repair.

E. Inspect No.9a and 9b Labyrinth Seal.

(1) Rubbing.

- (a) Slight rubbing within
F.C.S. limits.

Accept.

(2) Nicks and burrs.

Accept after
repair.

(3) Minor edge damage.

Accept after repair
providing that only
one blend is made
to each fin, that
finished blends are
not more than one-
half fin depth deep
or five times fin
depth long, that
all blends on
adjacent blades are
separated radially
by not less than
five times fin
depth at their
ends, and that
F.C.S. limits are
not violated.

NOTE: Greater damage will require repair (Ref.
72-31-04 Repair No.1).

F. Inspect Outer Sealing Ring Locating Dogs.

(1) Nicks and burrs.

- (a) Not more than 0.010 in.
(0,250 mm) deep.

Accept after
repair.

(2) Bending.

Accept after repair
providing repair
does not induce
cracking.

G. Inspect Rear Abutment Flange.

(1) Nicks and burrs.

Accept after
repair.

L. Inspect LP shaft D - Trap Locations.

(1) Indentation.

- (a) Indentation up to
0.010 in. (0,25 mm)
in depth.

Accept. (Raised
material and sharp
edges to be
removed).

M. Inspect LP Shaft Signal Tube Seal Location.

NOTE: The Sleeve (302-220), an integral part of the
LP Compressor Drive Shaft, is assembled on
manufacture and originally provides a sealing for
the seals on the LP Shaft Signal Tube (303-190).
A seal at this location is now redundant.

(1) Security of sleeve (302-220).

- (a) Sleeve secure in LP
Drive Shaft.

Accept.

N. Inspect External Finish (Ref.72-09-04 Repair for Areas
with External Finish and the Procedure for Application
of Finish).

NOTE: To enable the crack detection (magnetic particle)
to be carried out, the high heat resisting
aluminium enamel finish will have been removed
during cleaning.

10. Adjusting Washer (303-10 to 105)

NOTE: This item may require selection during assembly.

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores.

Accept provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

- (2) Fretting and wear.

Reject.

11. LP Compressor Drive Shaft Rear (303-120)

A. Carry Out Dimensional Checks (Ref.72-31-04 Fits and Clearances).

- (1) Check sleeve locating bore (F.C.S.601-148) and outer guide locating bore (F.C.S.601-157).

NOTE: Make these checks in conjunction with the Sleeve (303-170) and the LP Shaft Signal Generating Outer Guide (Ref.72-31-05).

- (a) Within F.C.S. limits.

Accept.

- (2) Check the LP turbine hub and centering ring location diameters (F.C.S.601-216/214).

NOTE: Make these checks in conjunction with the LP Turbine Hub and Centering Ring (Ref.72-52-02).

- (a) Within F.C.S. limits.

Accept.

- (3) Carry out "square" checks (Ref.72-09-00 Inspection/Check) on LP signal mechanism outer sleeve and LP hub unit locating serrations (F.C.S.601-155/220).

NOTE: Make these checks in conjunction with the LP Shaft Signal Outer Guide (Ref.72-31-05) and the LP Turbine Rotor Hub (Ref.72-52-02).

C. Inspect Internal Splines (Ref.72-09-00 Inspection/Check).

(1) Nicks and burrs.

- (a) Not more than 0.005 in.
(0,130 mm) in depth.

Accept after repair
providing F.C.S.
limits are
preserved.

D. Inspect Centre Spherical Mounting Locating Lugs.

(1) Nicks and burrs.

- (a) Not more than 0.005 in.
(0,130 mm) in depth.

Accept after
repair.

(2) Wear.

- (a) Not more than 0.002 in.
(0,050 mm) in depth on
the Spherical Centre
Mounting bearing surfaces.

Accept after
repair.

E. Inspect No.9a and 9b Labyrinth Seal.

(1) Rubbing.

- (a) Slight rubbing within
F.C.S. limits.

Accept.

(2) Nicks and burrs.

Accept after
repair.

(3) Minor edge damage.

Accept after repair providing that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that all blends on adjacent blades are separated radially by not less than five times fin depth at their ends, and that F.C.S. limits are not violated.

NOTE: Greater damage will require repair (Ref. 72-31-04 Repair No.1).

F. Inspect Outer Sealing Ring Locating Dogs.

(1) Nicks and burrs.

(a) Not more than 0.010 in.
(0,250 mm) deep.

Accept after repair.

(2) Bending.

Accept after repair providing repair does not induce cracking.

G. Inspect Rear Abutment Flange.

CAUTION: THE DRIVESHAFT REAR FLANGE FILLET RADIUS IS A CRITICAL AREA. (REF. FIG.304). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION. REFER TO PARAGRAPH 8.L.(1) FOR DEE HEAD BOLT LOCATION DAMAGE ACCEPTANCE LIMIT.

(1) Nicks and burrs.

Accept after repair.

(2) Scores.

- | | |
|---|-------------------------|
| (a) Not more than 0.005 in.
(0,130 mm) in depth. | Accept after
repair. |
|---|-------------------------|

(3) Wear.

- | | |
|------------------------------------|---------|
| (a) Minor witness of even
wear. | Accept. |
| (b) Any elongation of boltholes. | Reject. |

(4) Corrosion.

NOTE: For corrosion definitions refer to
Chapter 72-09-00.

- | | |
|--|---|
| (a) Superficial. | Accept. |
| (b) Light surface. | Accept. |
| (c) Isolated pitting
up to 0.005 in.
(0,130 mm) in depth. | Accept. |
| (d) Coalesced pitting
up to 0.005 in.
(0,130 mm) in depth. | Accept up to 20%
of surface affected
(surface to be
refurbished with
Scotchbrite.
Corrosion to be
neutralised using
Process H,
ref.72-09-00
cleaning). |

H. Inspect Flange Bolt Holes.

CAUTION: THE DRIVESHAFT REAR FLANGE BOLT HOLE BORE IS A
CRITICAL AREA. (REF. FIG.304). SPECIAL
ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS
OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

(1) Corrosion.

NOTE: For corrosion definitions refer to
Chapter 72-09-00.

D. Inspect Locking Sleeve Bore.

(1) Scores.

- (a) Not more than 0.005 in.
(0,130 mm) in depth.

Accept after repair
providing F.C.S.
limits are not
violated.

16. Sleeve (303-170)

A. Carry out Dimensional Checks (Ref.72-31-04 Fits and Clearances).

- (1) Check drive shaft location diameter (F.C.S.601-148).

NOTE: Make this check in conjunction with the LP
Compressor Drive Shaft Rear (para.11).

- (a) Within F.C.S. limits. Accept.

B. Inspect Sleeve.

- (1) Nicks and burrs.

Accept after
repair.

- (2) Wear.

- (a) Not more than 0.002 in.
(0,050 mm) in depth.

Accept after repair
providing F.C.S.
limits are not
violated.

17. LP Shaft Signal Tube Assembly (303-190)

A. Carry Out Dimensional Checks (Ref.72-31-04 Fits and Clearances).

- (1) Check serrated sleeve backlash at location serrations
(F.C.S.601-54).

NOTE: Make this check in conjunction with the
Serrated Sleeve (303-150).

NOTE: This is a compatibility check. Do not reject
unless backlash check is unsuccessful with a
series of serrated sleeves.

- (a) Within F.C.S. limits. Accept.

INSPECTION/CHECK

72-31-04

Page 315

OVERHAUL

- (2) Check seal ring groove width (F.C.S.601-147) and seal ring installed gap (F.C.S.601-160).

NOTE: Make these checks with a new or F.C.S. checked seal ring (303-180).

- (a) Within F.C.S. limits. Accept.

- (3) Check the following location diameters and bore:

Location	F.C.S. Ref.
Locking sleeve dia (para.15)	601-56
Inner guide dia (72-31-05)	601-149/151
Locking piece bore (72-31-05)	601-154
Adjusting washer dia (72-31-05)	601-159
Carbon bearings location dia (para.7)	601-75

NOTE: Make these checks in conjunction with the relevant items.

- (a) Within F.C.S. limits. Accept.

- (4) Carry out "square" check (Ref.72-09-00 Inspection/Check) on inner guide locating splines (F.C.S.601-150).

NOTE: Make this check in conjunction with the LP Signal Mechanism Inner Guide (Ref.72-31-05).

NOTE: This item has 24 equi-spaced external splines. Take dimensions at centre line of spline crests.

B. Inspect Splines (Ref.72-00-00 Inspection/Check).

- (1) Nicks and burrs.

- (a) Not more than 0.005 in.
(0,130 mm) in depth. Accept after repair providing F.C.S. limits are not violated.

- (2) Fretting.

- (a) Not more than 0.002 in.
(0,050 mm) above and below the machine witness face. Accept after repair providing F.C.S. limits are not violated.

C. Inspect Threads (Ref.72-09-00 Inspection/Check).

D. Inspect Sealing Ring Grooves.

- (1) Nicks and burrs.

Accept after
repair.

E. Inspect Signal Tube.

- (1) Distortion.

- (a) Any longitudinal
distortion.

Reject.

- (2) Nicks and burrs.

- (a) Small nicks and burrs.

Accept after
repair.

F. Inspect Locking Sleeve Location.

- (1) Wear.

- (a) Not more than 0.005 in.
(0,130 mm) in depth.

Accept after
repair.

- (2) Nicks and burrs.

Accept after
repair.

G. Inspect Collar at Rear End of Signal Tube.

- (1) Nicks and burrs.

Accept after
repair.

18. Seal Ring (303-180 - not illustrated)

NOTE: This item is replaceable at overhaul. If engine is removed prematurely, seal may be re-used provided normal overhaul life will not be exceeded and Inspection and F.C.S. checks are satisfactory.

A. Carry out Dimensional Checks (Ref.72-31-04 Fits and Clearances).

- (1) Check seal ring width and gap in position (F.C.S. 601-147/160).

NOTE: Make these checks in conjunction with the LP Signal Shaft (para.17) and the Sleeve (para.16).

- (a) Within F.C.S. limits.

Accept.

LP SHAFT SIGNAL SYSTEM GENERATING MECHANISM - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

72-31-05

Page 301

Table 303

4. Retaining Nut (302-10)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Keywasher Locking Slots.

(1) Damage.

Accept after repair
if slot profile is
restored.

C. Inspect Silver Plating.

(1) Damage or wear.

Reject for re-
plating (Ref.
72-09-08, Repair).

5. Keywasher (302-20) - Not Illustrated

A. Inspect Washer (Ref.72-09-00 Inspection/Check - Cupwashers).

B. Inspect Locating Keys.

NOTE: Make this check in conjunction with the Locking
Piece (302-30).

(1) Damage.

Accept after repair
if still compatible
with locations in
locking piece.

6. Locking Piece (302-30)

A. Inspect Splines.

(1) Nicks and burrs.

Accept, if repair
does not violate
F.C.S. limits.

(2) Wear and fretting.

(a) Smooth, even wear
and fretting.

Accept after repair
if F.C.S. limits
are not violated.

B. Inspect Signal Tube Location Diameter.

NOTE: Make this check in conjunction with the LP Shaft Signal Tube (Ref.72-31-04).

- (1) Nicks, burrs and scores.

Accept, if repair preserves compatibility with tube and F.C.S. limits are not violated.

C. Inspect Locating Dogs.

NOTE: Make this check in conjunction with the Plain Round Nut (302-40).

- (1) Damage.

Accept, if repair preserves compatibility with nut.

D. Inspect Keywasher Locating Slots.

NOTE: Make this check in conjunction with the Keywasher (302-20).

- (1) Damage.

Accept after repair if still compatible with keywasher.

E. Carry Out Dimensional Checks (Ref.72-31-05 Fits and Clearances).

- (1) Check signal tube locating diameter (F.C.S.601-154).

NOTE: Make this check in conjunction with LP Shaft Signal Tube (Ref.72-31-05).

- (a) Within F.C.S. limits.

Accept.

- (2) Check backlash of splines in Inner Guide (F.C.S.601-153).

NOTE: Make this check in conjunction with the Inner Guide (302-60).

- (a) Within F.C.S. limits.

Accept.

7. Plain Round Nut (302-40)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Locking Piece Location Dogs.

NOTE: Make this check in conjunction with the
Locking Piece (302-30).

(1) Damage.

Accept, if repair
preserves compat-
ibility with
locking piece.

C. Inspect Silver Plating.

(1) Damage or wear.

Reject for re-
plating (Ref.
72-09-08, Repair).

8. Helical Splined Nut (302-50)

A. Inspect Helical and External Splines (Ref.72-09-00
Standard Practices).

(1) Nicks and burrs.

Accept, if repair
does not violate
F.C.S. limits.

(2) Wear and fretting.

(a) Smooth, even wear
and fretting.

Accept after repair
if F.C.S. limits
are not violated.

B. Inspect Inner Guide Location Bore.

(1) Damage.

Accept after repair
if F.C.S. limits
are not violated.

C. Inspect Actuating Arm Abutment Face.

(1) Wear and fretting.

(a) Any witness of contact
by actuating arm.

Reject and
investigate cause.

D. Carry Out Dimensional Checks (Ref.72-31-05 Fits and
Clearances).

(1) Check locating bore (F.C.S.601-152).

NOTE: Make this check in conjunction with the Inner
Guide (302-60).

(a) Within F.C.S. limits.

Accept.

- (2) Check backlash of splines with inner and outer guides (F.C.S.601-156 and 158).

NOTE: Make this check in conjunction with the Inner and Outer Guides (302-60/90).

- (a) Within F.C.S. limits. Accept after repair.

9. Inner Guide (302-60)

A. Inspect Helical and Internal Splines (Ref.72-09-00 Inspection/Check).

- (1) Nicks and burrs. Accept, if repair does not violate F.C.S. limits.

(2) Wear and fretting.

- (a) Smooth, even wear and fretting. Accept after repair if F.C.S. limits are not violated.

B. Inspect Helical Splined Nut Location.

- (1) Nicks and burrs. Accept, if repair does not violate F.C.S. limits.

(2) Wear and fretting.

- (a) Any stepped wear or fretting. Reject.

- (b) Light witness mark, within F.C.S. limits. Accept.

C. Inspect Threads (Ref.72-09-00 Inspection/Check).

D. Inspect Signal Tube Location Bores.

- (1) Damage. Accept after repair if F.C.S. limits are not violated.

E. Inspect Adjusting Washer Abutment Face.

- (1) Nicks, burrs and scores.

- (a) Not more than 0.005 in.
(0,130 mm).

Accept after repair
if surface flatness
and squareness are
preserved.

F. Carry Out Dimensional Checks (Ref.72-31-05 Fits and Clearances).

- (1) Check both signal tube location bores (F.C.S.601-149/151).

NOTE: Make this check in conjunction with the LP
Shaft Signal Tube (Ref.72-31-05).

- (a) Within F.C.S. limits. Accept.

- (2) Check helical splined nut location diameter
(F.C.S.601-152).

NOTE: Make this check in conjunction with the Helical
Splined Nut (302-50).

- (a) Within F.C.S. limits. Accept.

- (3) Check backlash of short internal splines and of
helical splines (F.C.S.601-153/156).

NOTE: Make this check in conjunction with the Locking
Piece (302-30) and the Helical Splined Nut
(302-50).

- (4) Carry out "square" check (Ref.72-09-00) of LP signal
shaft location splines (F.C.S.601-150).

NOTE: Make this check in conjunction with the LP
Signal Shaft (Ref.72-31-04).

NOTE: This item has 24 internal splines equi-spaced.

- (a) Any side of square out-
side F.C.S. limits. Reject.

- (b) Within F.C.S. limits. Accept.

10. Retaining Nut (302-70)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Keywasher Locating Face.

(1) Nicks, burrs and scores.

(a) Not more than 0.005 in.
(0,130 mm) in depth.

Accept after repair
if 90 per cent
contact is retained.

C. Inspect Keywasher Locking Slots.

(1) Damage.

Accept after repair
if slot profile is
restored.

D. Inspect Silver Plating.

(1) Damage or wear.

Reject for re-
plating (Ref.
72-09-08, Repair).

11. Keywasher (302-80)

A. Inspect Washer (Ref.72-09-00 Inspection/Check - Cupwashers).

B. Inspect Locating Keys.

NOTE: Make this check in conjunction with the Outer
Guide (302-90).

(1) Damage.

Accept after repair
if still compatible
with locations in
outer guide.

12. Outer Guide (302-90)

A. Inspect Internal and External Splines (Ref.72-09-00
Inspection/Check).

(1) Nicks and burrs.

Accept, if repair
does not violate
F.C.S. limits.

(2) Wear and fretting.

(a) Smooth, even wear

Accept after repair
if F.C.S. limits
are not violated.

B. Inspect LP Drive Shaft Location Diameters.

(1) Nicks, burrs and scores.

Accept, if repair
does not violate
F.C.S. limits.

C. Inspect Keywasher Locating Slots.

NOTE: Make this check in conjunction with the Keywasher (302-80).

- (1) Damage.

Accept after repair
if still compatible
with keywasher.

D. Carry Out Dimensional Checks (Ref.72-31-05 Fits and Clearances).

- (1) Carry out "square" check (Ref.72-09-00 Inspection/Check) on LP drive shaft location serrations (F.C.S. 601-155).

NOTE: Make this check in conjunction with the LP Compressor Rear Drive Shaft (Ref.72-31-04).

NOTE: This item has 40 equi-spaced external serrations.

- (a) Any side of square outside F.C.S. limits. Reject.

- (b) Within F.C.S. limits. Accept.

- (2) Check backlash of internal splines (F.C.S.601-158).

NOTE: Make this check in conjunction with the Helical Splined Nut (302-50).

- (a) Within F.C.S. limits. Accept.

- (3) Check diameter at LP shaft location (F.C.S.601-157).

NOTE: Make this check in conjunction with the LP Compressor Rear Drive Shaft (Ref.72-31-04).

- (a) Within F.C.S. limits. Accept.

13. Adjusting Washer (302-100)

NOTE: This item may require selection during assembly.

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores.

Accept, provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

- (2) Fretting and wear.

Reject.

B. Carry Out Dimensional Checks (Ref.72-31-05 Fits and Clearances).

- (1) Check washer bore (F.C.S.601-159).

NOTE: Make this check in conjunction with the LP Shaft Signal Tube (Ref.72-31-04).

- (a) Within F.C.S. limits.

Accept.

OVERHAUL

COMPRESSOR INTERMEDIATE CASE - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.
- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

Cross References to Illustrated Parts Catalogue
Table 3034. Bevel Zerol Driver Gear (302-40)

A. Inspect Gear Teeth (Ref.72-09-00 Inspection/Check).

(1) Nicks and burrs.

Accept, if repair
does not violate
F.C.S. limits
during assembly
(Ref.72-32-00
Assembly).

(2) Fretting.

(a) Not more than 0.001 in.
(0,0254 mm) in depth.Accept if repair
does not violate
F.C.S. limits
during assembly
(Ref.72-32-00
Assembly).

B. Inspect Splines (Ref.72-09-00 Inspection/Check).

(1) Nicks and burrs.

Accept, if repair
does not violate
F.C.S. limits
during assembly
(Ref.72-32-00
Assembly).

(2) Fretting and wear.

- (a) Not more than 0.001 in.
(0,030 mm) below machin-
ing witness mark.

Accept, if repair
does not violate
F.C.S. limits
during assembly
(Ref.72-32-00
Assembly).

C. Inspect Adjusting Washer Location Face.

- (1) Nicks and burrs.

Accept after
repair.

- (2) Scores.

- (a) Not more than 0.003 in.
(0,080 mm) deep.

Accept after
repair.

D. Inspect Headed Pin Locations.

NOTE: Carry out this inspection in conjunction with the
headed pins (para.5).

- (1) Damage.

- (a) Any damage other than
slight edge burrs.

Reject.

- (b) Slight edge burrs only.

Accept after
repair.

- (2) Compatibility.

- (a) Pin compatible with bore.

Accept.

5. Headed Pins - 6 Off (302-30)

A. Inspect Pins.

- (1) Any damage.

Reject.

- (2) Check compatibility with
bevel gear (para.4).

Accept if compat-
ible.

INSPECTION/CHECK

OVERHAUL

6. Adjusting Washers (302-50)

NOTE: This item may require selection during assembly.

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores.

Accept, provided that repair preserves surface flatness and that designed effective thickness, is maintained over 90 per cent of contact face area.

- (2) Fretting and wear.

Reject.

7. Bearing Retaining Ring (302-170)

A. Inspect Abutment Face.

- (1) Nicks and burrs.

Accept after repair.

B. Inspect Locating Dogs.

- (1) Nicks and burrs.

Accept after repair.

- (2) Wear.

- (a) Not more than 0.001 in.
(0,030 mm) on flanks.

Accept.

- (3) Distortion.

Reject.

C. Inspect Bolt Locations.

- (1) Fretting and wear.

- (a) Not elongated more than
0.010 in. (0,250 mm);
flange thickness not
reduced more than
5 per cent.

Accept.

- (2) Nicks and burrs.

Accept after repair.

8. LP Compressor Thrust Bearing (302-190) (Ref.SB.72-17 Part 6 and 72-79 Part 3)

A. Inspect Bearing (Ref.72-09-00 Inspection/Check).

B. Carry Out Dimensional Checks.

(1) Check bore and diameter (F.C.S.601-51/69).

NOTE: Make this check in conjunction with the bearing housing (para.10) and the LP rotor rear shaft (Ref.72-31-03).

(a) Within F.C.S. limits. Accept.

(2) Check bearing end-float and diametral clearance (F.C.S.601-66).

(a) Within F.C.S. limits. Accept.

9. Oil Throwers (302-200 and 303-120)

NOTE: These two items are standard components on engines that do not incorporate SB.72-21 and SB.72-29 respectively. Engines on which these modifications have been made employ a range of adjusting Oil Throwers that may require selection during assembly (Ref.72-32-00 Assembly and the Illustrated Parts Catalogue).

A. Inspect Abutment Faces (Standard Items).

(1) Nicks, burrs and scores. Accept after repair.

B. Inspect Abutment Faces (Adjusting Oil Throwers).

(1) Nicks, burrs and scores. Accept provided repair preserves surface flatness and designed effective thickness is maintained over 90 per cent of face area.

(2) Fretting and wear. Reject.

10. LP Compressor Thrust Bearing Housing (302-270)

NOTE: If SB.72-17 Part 2 is embodied, the thrust washer (302-300) and housing must be retained as a matched set.

A. Inspect Bearing Location Bores.

(1) Nicks and burrs.

Accept after
repair, if F.C.S.
limits are not
violated.

(2) Scores.

(a) Not more than 0.005 in.
(0,130 mm) deep.

Accept after
repair, if F.C.S.
limits are not
violated.

B. Inspect Thread Insert (Ref.72-09-00 Inspection/Check).

C. Inspect Abutment and Location Faces.

(1) Nicks, burrs and scores.

Accept, if
repair does not
violate F.C.S.
limits.

D. Inspect Bolt Locations.

(1) Wear and fretting.

(a) Holes not elongated
more than 0.010 in.
(0,250 mm); flange
thickness not reduced
more than 5 per cent.

Accept.

E. Inspect Locating Pin Bores.

NOTE: Carry out this inspection in conjunction with the pins (para.12).

(1) Damage.

(a) Any damage other than
slight edge burrs.

Reject.

(b) Slight edge burrs only.

Accept after
repair.

(2) Compatibility.

(a) Pin compatible with bore.

Accept.

F. Inspect Metaflex Seal and Inner Case Location Bores.

(1) Nicks, burrs and scores.

- (a) Not more than 0.005 in.
(0,130 mm) deep.

Accept, if repair
does not violate
F.C.S. limits.

G. Inspect Oil Transfer Tube Location.

- (1) Nicks, burrs and scores.

- (a) Not more than 0.001 in.
(0,030 mm) deep.

Accept, if repair
preserves sealing
capability.

- (2) Fretting and wear.

- (a) Even, unstepped, not more
than 0.001 in. (0,030 mm)
deep.

Accept.

H. Carry Out Dimensional Checks.

- (1) Check bearing location bore (F.C.S.601-69).

NOTE: Carry out this check in conjunction with the
LP compressor thrust bearing (para.8).

- (a) Within F.C.S. limits. Accept.

- (2) Check location bores for inner and outer cases
(F.C.S.601-67 and 68).

NOTE: Carry out this check in conjunction with the
inner and outer cases (paras.61 and 62).

- (a) Within F.C.S. limits. Accept.

11. Thrust Washer (302-300)

NOTE: If SB.72-17 Part 2 is embodied the thrust bearing
housing (302-270) and thrust washer must be retained
as a matched set.

A. Inspect Abutment Faces and Diameters.

- (1) Nicks, burrs and scores.

Accept after
repair.

B. Inspect Pin Locations.

NOTE: Carry out this inspection in conjunction with the
pins (para.12).

- (1) Damage.

- (a) Any damage other than
slight edge burrs. Reject.

OVERHAUL

(b) Slight edge burrs only.

Accept after
repair.

(2) Compatibility.

(a) Pins compatible with ring.

Accept.

12. Pins - 8 Off (302-310)

A. Inspect Pins.

(1) Any damage.

Reject.

(2) Check compatibility with
thrust ring and housing
(para.10 and 11).

Accept if
compatible.

13. Metaflex Seals (302-320, 303-70/230, 305-80/390 and
306-105 (2 Off)) (Not Illustrated)

A. Inspect Seals.

WARNING: METAFLEX SEALS CONTAIN CHRYSOTILE (WHITE
ASBESTOS). THERE IS NO HEALTH HAZARD PROVIDING
THE PRECAUTIONS DETAILED IN THE ASSEMBLY
PROCEDURES ARE OBSERVED (REF.72-32-00 ASSEMBLY).

(1) Damage.

(a) Spot weld failure,
nicks or scores.

Reject.

(b) Laminations parted.

Accept providing
sealing capabilities
are unimpaired.

(2) Distortion.

Accept providing
sealing capabilities
are unimpaired and
compatibility is
maintained.

B. Carry Out Dimensional Checks.

NOTE: The Metaflex seal width must be between 0.003 and
0.008 in. (0,075 and 0,200 mm) greater than the
depth of its groove location.

(1) Seal within limits.

Accept.

14. Inner Labyrinth Housing (302-330)

A. Inspect No.4 Labyrinth Seal Housing Bore.

NOTE: This housing is designed to accept some settlement of the rotor shaft, due to the absence of the squeeze-film at the thrust bearings when the engine is static. For this reason there is a change in seal bore radius from slightly below the horizontal centreline; this provides an additional 0.006-0.007 in. (0,150-0,180 mm) clearance at the bottom vertical centreline. This designed additional clearance must be accounted for during any seal bore inspection or check.

- | | |
|--|---|
| (1) Nicks and burrs. | Accept after repair. |
| (2) Grooving. | |
| (a) Any damage greater than (b). | Accept after repair (Ref.72-32-00 Repair No.4). |
| (b) Any number of grooves, provided that they are all contained within an arc not greater than 60 degrees of bore mean circumference, that maximum depth is not greater than 0.005 in. (0,130 mm) and that F.C.S. limits are not violated. | Accept. |
| (3) Distortion. | |
| (a) Provided that minimum local clearance is not more than 0.006 in. (0,150 mm) below the minimum permissible dimension in the F.C.S. | Accept. |

B. Inspect No.5 Windback Seal Housing Bore.

NOTE: This housing is designed to accept some settlement of the rotor shaft, due to the absence of the squeeze-film at the thrust bearings when the engine is static. For this reason there is a change in seal bore radius from slightly below the horizontal centreline; this provides an additional 0.006-0.007 in. (0,150-0,180 mm) clearance at the bottom vertical centreline. This designed additional clearance must be accounted for during any seal bore inspection or check.

- (1) Nicks and burrs. Accept after repair.
- (2) Grooving.
 - (a) Any damage greater than (b). Accept after repair (Ref.72-32-00 Repair No.4).
 - (b) Rubbing extending over an arc not greater than 90 degrees and regardless of width over face, provided that maximum depth does not exceed 0.005 in. (0,130 mm) and that F.C.S. limits are not violated. Accept.
- (3) Distortion.
 - (a) Provided that minimum local clearance is not more than 0.006 in. (0,150 mm) below minimum permissible dimension in F.C.S. Accept.

C. Inspect All Abutment and Location Faces.

- (1) Nicks and burrs. Accept after repair.
- (2) Scores.
 - (a) Not more than 0.005 in. (0,130 mm) deep. Accept after repair.

OVERHAUL

18. Rear Outer Air Baffle (303-30) (Ref.SB.72-91)

A. Inspect No.8 Labyrinth Seal Housing Bore.

NOTE: This housing is designed to accept some settlement of the rotor shafts, due to the absence of the squeeze-film at the thrust bearings when the engine is static. For this reason, there is a change in seal bore radius at a point slightly below the horizontal centreline; this provides an additional 0.006-0.007 in. (0,150-0,180 mm) clearance at the bottom vertical centreline. This designed additional clearance must be accounted for during any seal bore inspection or check.

- | | |
|--|--|

A. Inspect Bracket.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear and fretting.
 - (a) Attachment face thickness reduced by not more than 5 per cent. Accept.
 - (b) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.
- (3) Scoring.
 - (a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair providing material thickness is not reduced by more than 5 per cent.
- (4) Distortion. Accept if compatibility is preserved.

69. Plugs - 6 Off (307-60)

A. Inspect Abutment Face and Locating Diameter.

(1) Nicks, burrs and scores.

- (a) Not more than 0.005 in. Accept after
(0,130 mm) deep. repair.

B. Inspect Bolt Locations.

(1) Wear and fretting.

- (a) Bolt holes elongated Accept.
not more than 0.030 in.
(0,760 mm); flange
thickness not reduced
more than 5 per cent.

70. Locating Peg (307-80) and Locating Shoulder Pins - 6 Off (307-90)

A. Inspect Peg and Pins.

- (1) Damage. Reject.
(2) Compatibility.

NOTE: Make this check in conjunction with the intermediate outer case (para.71), the outer case (para.62) and the air baffle (para.26).

- (a) Peg and pins compatible Accept.
with cases and baffle.

71. Intermediate Outer Case (307-100)

A. Inspect Self-locking Shank Nuts (Ref.72-09-00 Inspection/Check).

B. Inspect Thread Inserts (Ref.72-09-00 Inspection/Check).

- (1) Damage. Reject for repair.
(2) Security.
(a) Locking pins damaged, Reject for repair.
loose or missing.

(3) Silver plating.

(a) Bolt seized in insert. Reject for repair.

C. Inspect All Abutment Faces and Locating Bosses.

(1) Nicks, burrs and scores.

(a) Not more than 0.005 in.
(0,130 mm) deep. Accept after repair.

(2) Wear and fretting.

(a) Bolt holes elongated
not more than 0.010 in.
(0,250 mm); flange
thickness not reduced
more than 5 per cent. Accept.

D. Inspect All Pin Locations.

(1) Damage.

(a) Small edge burrs only. Accept after repair.

(2) Compatibility.

NOTE: Make this check in conjunction with the
pins (paras.65-67 and 70).

(a) Pins compatible with case. Accept.

E. Inspect Vanes.

(1) Dents.

(a) Smooth contoured, with
no impact marks and not
fouling tubes or drives. Accept.

F. Inspect T₃ Probe Plug Location Bores.

(1) Nicks, burrs and scores.

(a) Not more than 0.005 in.
(0,130 mm) deep. Accept after repair.

G. Inspect Air Elbows.

(1) Nicks and burrs.

(a) Not more than 0.005 in.
(0,130 mm) deep at
abutment faces. Accept after repair.

(2) Dents.

- (a) Smooth contoured, with no impact marks. Accept.

H. Inspect Rokide Coating (Ref. 72-09-10 Repair for the Procedure for Application of Coating).

NOTE: Before assessing amounts of damage, examine any chipped areas for faulty adhesion at edges; remove suspect coating and dress edges.

- (1) Any chipped area greater than 2 sq. in. (1290,32 sq. mm). Reject for repair.
- (2) No area greater than 2 sq. in. (1290,32 sq. mm):-
- (a) More than one area of chipping on one vane. Reject for repair.
- (b) More than three areas of chipping on any outer case inter vane segment. Reject for repair.
- (c) Damage less than (a) and (b). Accept after dressing.

72. Adjusting Shim (308-180 to 235), Adjusting Plate (309-40 to 85/150 to 170)

NOTE: These items will require selection during assembly.

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores. Accept provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

Reject.

73. Gearbox Mounting Bracket Assemblies (308-310)

A. Inspect Shank Self-locking Nuts (Ref.72-09-00 Inspection/Check).

B. Inspect Attachment Faces.

(1) Wear.

(a) Not more than 10 per cent reduction of flange thickness.

Accept after repair providing surface flatness is maintained.

(b) Bolt-holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

(c) Hollow pin holes elongated.

Reject.

(2) Scores.

(a) Not more than 0.010 in. (0,250 mm) in depth on contact faces.

Accept after repair providing flange thickness is not reduced by more than 10 per cent.

C. Inspect General Condition of Mounting Bracket.

(1) Nicks and burrs.

Accept after repair.

74. Air Seal Retainer (308-60)

A. Inspect Attachment Faces.

(1) Wear.

(a) Not more than 10 per cent reduction in flange thickness.

Accept after repair.

HP COMPRESSOR CASE AND VANES - INSPECTION CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

4. Vane Retainer (302-30/310)

A. Inspect Vane Retainer.

- | | |
|--|----------------------|
| (1) Nicks and burrs. | Accept after repair. |
| (2) Wear. | |
| (a) Not more than 5 per cent reduction in attachment flange thickness. | Accept after repair. |
| (b) Bolt holes elongated not more than 0.030 in. (0,760 mm) | Accept after repair. |
| (c) Vane location groove worn not more than 0.005 in. (0,130 mm). | Accept after repair. |

5. Labyrinth Retainer Plate (302-60/340)

A. Inspect Labyrinth Retainer Plate.

- | | |
|----------------------|----------------------|
| (1) Nicks and burrs. | Accept after repair. |
|----------------------|----------------------|

(2) Wear.

(a) Vane location groove.

(i) Pre SB.0L.593-72-8694-297 standard vane inner fixing ring, wear not more than 0.008 in. (0,20 mm) in depth on the upper and lower hook surfaces or on the base of the groove. Accept after repair.

(ii) SB.0L.593-72-8694-297 standard vane inner fixing ring (anti-fret liners). Service run vane inner fixing rings which have subsequently been modified to this standard and which show witness of "ratchet" type wear in the faces of the groove. Accept subject to the limits detailed in SB.0L.593-72-8694-297.

(b) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

C. Inspect Labyrinth Location Flange.

(1) Nicks and burrs. Accept after repair providing F.C.S. limits are not violated.

(2) Wear.

(a) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

OVERHAUL

- (b) Light fretting not more than 0.002 in. (0,050 mm) on labyrinth flange.

Accept providing F.C.S. limits are not violated.

7. Labyrinth Ring (302-90/370)

- A. Carry Out Dimensional Checks (Ref.72-33-00 Fits and Clearances F.C.S. 601-89/90/96/97).

NOTE: Carry out these checks in conjunction with the Inner Vane Fixing Ring (302-80/360), the Front Rotor Shaft (72-33-02) and the Spacer Ring Stages 2 and 3 (72-33-02).

NOTE: Remove any burrs or metal build-up prior to carrying out these checks.

- B. Labyrinth Ring Seal Housing Bore.

- (1) Nicks and burrs.

Accept after repair.

- (2) Wear.

- (a) Damage greater than (b).

Accept after repair (Ref. 72-33-01 Repair No.1).

- (b) Any number of grooves, provided that they are all contained within an arc not greater than 90 degrees of bore mean circumference, that maximum depth is not greater than 0.010 in. (0,250 mm) and that F.C.S. limits are not violated.

Accept.

- (3) Distortion.

- (a) Provided that minimum local clearance is not more than 0.006 in. (0,150 mm) below the minimum permissible dimension in the F.C.S.

Accept.

C. Inspect Vane Fixing Ring Location.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
 - (a) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.
 - (b) Light fretting not more than 0.002 in. (0,050 mm) on vane fixing ring flange. Accept providing F.C.S. limits are not violated.

8. Sleeve (302-110/120/140/210/390/400/420, 303-20/70/120/210, 304-20/70)

A. Inspect Sleeve.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
 - (a) Not more than 0.010 in. (0,250 mm) at sleeve ends. Accept providing sleeve ends are parallel.

9. Retaining Plate (302-170/240/450)

A. Inspect Retaining Plate.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
 - (a) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

10. Air Supply Block (302-190)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

(4) Chipping.

(a) Not more than 10 per cent of hard coating chipped. Accept.

(b) 10 per cent or more of hard coating removed. Accept after repair (i.e. recoating).

C. Inspect Vane Inner Fixing Hook Surfaces Stages 1 and 2.

(1) Nicks and burrs. Accept after repair.

(2) Wear.

(a) Not more than 0.010 in. (0,250 mm) on upper and lower hook surfaces. Accept after repair.

(3) Scores.

(a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair, subject to satisfactory crack detection.

(4) Damage to corners (Ref. Fig.310 Detail A).

NOTE: Damage is acceptable on one corner of each hook.

(a) Dimension 'A' not more than 0.25 in. (6,350 mm) and dimension 'B' not more than 0.15 in. (3,810 mm). Accept after repair.

D. Inspect Vane Outer Fixing Surfaces Stages 1 and 2 (Ref. Fig.310 Detail B).

(1) Nicks and burrs. Accept after repair.

(2) Wear.

(a) Not more than 0.002 in. (0,05 mm) in depth on 'C' and 'D' surfaces. Accept.

(b) Not more than 0.003 in. Accept.
(0,08 mm) in depth over
less than 67 per cent of
the surface area of each
surface 'E'.

(c) Not more than 0.001 in. Accept.
(0,025 mm) in depth on
surfaces 'E' not covered
in (b).

E. Inspect Vane Outer Fixing Surfaces Stages 3 to 6 and Exit
Guide (Ref. Fig.310 Detail B).

(1) Nicks and burrs. Accept after
repair.

(2) Wear.

(a) Not more than 0.001 in. Accept.
(0,025 mm) in depth on
'E' surface, or 0.002 in.
(0,050 mm) in depth on
'C' and 'D' surfaces.

F. Inspect Vane Aerofoil.

(1) Inspect to acceptance and blending standard
(Ref.72-33-01, Repair No.2).

G. Inspect Probe Locations.

(1) Nicks and burrs. Accept after
repair.

12. Probe Mounting Block (303-60/160, 304-100)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Probe Mounting Block.

(1) Nicks and burrs. Accept after
repair.

(2) Wear.

(a) Bolt holes elongated Accept after
not more than 0.030 in. repair.
(0,760 mm).

(4) Distortion.

(a) Any distortion.

Reject.

16. Bracket Assembly (306-270)

A. Inspect Tube (Ref.72-09-00 Inspection/Check).

B. Inspect Attachment Flange.

(1) Nicks and burrs.

Accept after
repair.

(2) Wear and fretting.

(a) Not more than 5 per cent
reduction in flange
thickness.

Accept.

(b) Bolt holes elongated
not more than 0.010 in.
(0,250 mm).

Accept after
repair.

(3) Scores.

(a) Not more than 0.010 in.
(0,250 mm) in depth.

Accept after repair
providing material
thickness is not
reduced by more
than 5 per cent.

(b) Any distortion on
attachment bracket.

Accept providing
HP compressor case
contour and com-
patibility is
preserved.

C. Inspect Assembly.

(1) Distortion.

(a) Any distortion on
lifting tube.

Reject.

HP COMPRESSOR ROTOR - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.
- F. Certain types of blade damage can be repaired in-situ, without dismantling the engine. For details of in-situ blade blending and acceptance limits refer to 72-09-31 LP and HP Compressor Rotor Blades - Repair by In-situ Blending.

OVERHAUL

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards. Special attention must be paid to the critical areas of certain specified items during inspection. An instruction to this effect is included in the inspection detailed for the specified item.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

Items marked with an asterisk (*) in Table 301 feature defined critical areas. (Ref.Figs.308 and 309). In addition to the general overall crack detection examination, special attention must also be paid to these defined critical areas during the inspection.

TEMPORARY
REVISION**

British airways

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No.0-2

Dennis Horsfield

For Chief Technical and Industrial Services Engineer CAA Design Approval No.DAI/8566/78

TEMPORARY REVISION NO.72-566

Insert in 72-33-02 after page 302

REASON FOR ISSUE

To add a BEOL procedure following Table 301

ACTION

(3) BEOL PROCEDURE

The following process may be used in lieu of process MP1 specified in Table 301.

Equipment and Materials

- (a) Magnaflux Model X2152 Pancake Coil and Knife Switch Unit.
- (b) Magnaflux TAQ 1205 three phase full wave rectified power supply connected to (a) by twin cables.
- (c) Ardrex type 851-3 ink containing 0.2 to 0.3% fluorescent magnetic particle inspection powder.

Procedure

The items tabulated below can be crack detected using the following method:-

Fig. No.	Item No.	Description
302	300	Stage 2 Disc
302	330	Stage 2 - 3 Spacer Ring
302	350	Stage 3 Disc

- (1) Demagnetise
- (2) Magnetise using Knife Switch 3000A. Item being magnetised must be rotated through coil.
- (3) Apply ink on residual techniques.
- (4) Inspect under U.V. light.
- (5) Demagnetise.
- (6) Magnetise using pancake Coil 2800A.
- (7) Apply ink on residual techniques.
- (8) Inspect under U.V. light.
- (9) Demagnetise.

CAUTION: THIS IS A ROTATING ASSEMBLY. ENSURE THAT ANY FREE OR CAPTIVE SELF-LOCKING NUTS (REGARDLESS OF SIZE) HAVE BEEN REPLACED BEFORE THE ASSEMBLY IS RELEASED FOR SERVICE (REF.72-09-00 INSPECTION/CHECK). FAILURE TO DO SO MAY RESULT IN ENGINE DAMAGE.

NOTE: Inspect balancing weights (302-180, 304-140) or washers for general condition. Reject any damaged items; any attempt at repair will render them suspect for balancing purposes. Retain any undamaged items for possible selection and use during assembly.

4. Adjusting Washer (302-10 to 105 SB.72-29 or 302-30 to 150 Pre SB.72-29)

NOTE: These items require selection during assembly.

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores.

Accept provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

- (2) Fretting and wear.

Reject.

5. Shouldered Bolts (302-200/310/360, 303-30/80 and 304-320/380)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Locating Diameters.

(1) Wear, nicks and burrs.

Accept after
repair, if F.C.S.
limits are not
violated.

C. Carry Out Dimensional Checks.

NOTE: Carry out these checks in conjunction with the Rotor Disks (para.9), Spacer Rings (paras. 12 and 13), the Front Rotor Shaft (para.10) and the HP Compressor Drive Shaft (para.16).

(1) Check locating diameters (Ref.72-33-00 Fits and Clearances) as follows:

Bolt	F.C.S. Ref.
302-200	601-87/88
302-310	601-91/93/95
302-360	601-99/100/101
303-30	601-104/105/106
303-80	601-109/110/111
304-320	601-122/123/125
304-380	601-114/115/116

(a) Within F.C.S. limits.

Accept.

6. Externally Relieved Body Bolts (302-250)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Locating Diameters.

(1) Nicks and burrs.

Accept after
repair.7. Dee-headed Bolts (304-350) (Pre SB.72-7913-99)

NOTE: SB.72-7913-99 standard bolts are lifed at one build only and must be discarded at each dis-assembly.

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

INSPECTION/CHECK

B. Inspect Locating Diameters.

- (1) Wear, nicks and burrs.

Accept after
repair, if F.C.S.
limits are not
violated.

C. Carry Out Dimensional Checks.

- (1) Check locating diameter (F.C.S. 601-119).

(a) Within F.C.S. limits. Accept.

8. Compressor Blades (302-210/280/340, 303-10/60/110 and 304-360)

NOTE: Where there has been a Stage 1 HP Compressor rotor blade failure, or one or more similar blades are found cracked, the complete set of Stage 1 blades must be rejected.

A. Inspect Blade Fir-tree Form (Ref.Fig.305).

- (1) Fretting.

(a) Any fretting on the loaded flanks that just produces a step between the fretted and non-fretted surfaces at the ends of the inner surfaces. Reject.

NOTE: Where there is visible fretting, the step may be detected by traversing a 0.040 in. (1,00 mm) scribe or similar instrument over the fretted and non-fretted surfaces.

(2) Nicks and burrs. Accept after repair.

B. Inspect Blade Aerofoil.

- (1) Inspect to acceptance and blending standard (Ref.72-33-02 Repair No.6).

INSPECTION/CHECK

9. Rotor Disks, Stage 1 (302-230), Stage 2 (302-300), Stage 3 (302-350), Stage 4 (303-20), Stage 5 (303-70), Stage 6 (303-120) and Stage 7 (304-370)

CAUTION: THE RIM SLOT BOTTOM IS A CRITICAL AREA. (Ref.Fig.308). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

A. Inspect Blade Fir-tree Form Locations (Ref.Fig.305).

(1) Fretting.

- | | |
|--|---------|
| (a) Any fretting on the loaded flanks that just produces a step between the fretting and non-fretted surfaces at the ends of the inner surfaces. | Reject. |
|--|---------|

NOTE: Where there is visible fretting, the step may be detected by traversing a 0.040 in. (1,00 mm) scriber or similar instrument over the fretted and non-fretted surfaces.

- | | |
|----------------------|--------------------------------------|
| (2) Nicks and burrs. | Accept, if repair preserves profile. |
|----------------------|--------------------------------------|

B. Inspect Bolt Location Bores.

CAUTION: THE MAIN BOLT HOLE BORE INCLUDING STAGE 7 DISC RIM BOLT HOLE BORE, IS A CRITICAL AREA. (Ref.Fig.308). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

(1) Wear.

- | | |
|-----------------------------|--|
| (a) Smooth, unstepped wear. | Accept, if F.C.S. limits are met. |
| (2) Scores. | Reject. |
| (3) Nicks and burrs. | Accept after repair if F.C.S. limits are not violated. |

- C. Inspect Abutment Location Surfaces of Front Rotor Shaft (Stage 2), HP Turbine Shaft (Stage 7) and Spacer Rings (All Stages).

CAUTION: THE STAGE 7 ROTOR DISK SPIGOT RADIUS IS A CRITICAL AREA (Ref.Fig.308). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

- (1) Nicks and burrs. Accept after repair providing F.C.S. limits are not violated.

- D. Carry Out Dimensional Checks.

NOTE: Carry out these checks in conjunction with the Shouldered Bolts (para.5), the Front Rotor Shaft (para.10), the Spacer Rings (para.12 and 13) and the HP Compressor Drive Shaft (para.16).

- (1) Check the shouldered bolt bores (Ref.72-33-00 Fits and Clearances) as follows:

Location	F.C.S.
Stage 1 disk	601-87
Stage 2 disk	601-93
Stage 3 disk	601-100
Stage 4 disk	601-105
Stage 5 disk	601-110
Stage 6 disk	601-115
Stage 7 disk	601-123

- (a) Within F.C.S. limits. Accept.

- (2) Check the following spacer ring location diameters and bores:

Location	F.C.S.
Stage 2 disk (dia.)	601-92/94
Stage 3 disk (bores)	601-98/102
Stage 4 disk (bores)	601-103/107
Stage 5 disk (bores)	601-108/112
Stage 6 disk (bores)	601-113/117
Stage 7 disk (bores)	601-118/121/124

- (a) Within F.C.S. limits. Accept

(1) Nicks, burrs and scores.

Accept after
repair, providing
F.C.S. limits are
not violated.

J. Inspect No.6 Windback and Nos.7, 8 and HP1 Labyrinth Fins
(Ref.SB.72-91).

(1) Rubbing.

(a) Slight rubbing, within
F.C.S. limits.

Accept.

(2) Nicks and burrs.

Accept after
repair.

(3) Damage to fin edges.

Accept after
repair, providing
that only one
blend is made to
each fin, that
finished blends are
not more than one-
half fin depth deep
or five times fin
depth long, that
all blends on adja-
cent fins are
separated radially
by not less than
five times fin
depth at their
ends, and that
F.C.S. limits are
not violated.

NOTE: Greater damage will require repair
(Ref.72-33-02 Repair No.1, No.4, No.7,
No.8 and No.9).

K. Carry Out Dimensional Checks.

NOTE: Carry out these checks in conjunction with the Shouldered Bolts (para.5), the Air Transfer Tube (para.17) and the Rotor Disks (para.9).

- (1) Check the shaft diameters (Ref.72-33-00 Fits and Clearances) as follows:

Location	F.C.S.
Probe operating labyrinth	601-60
Thrust bearing	601-78
No.6 windback seal	601-79/80
No.7 labyrinth seal	601-82
No.8 labyrinth seal	601-83/84/85
HPL labyrinth seal	601-89

(a) Within F.C.S. limits. Accept.

- (2) Check the following shaft bores:

Location	F.C.S.
Air transfer tube	601-86
No.1 disk retaining bolts	601-88
No.2 disk retaining bolts	601-91
No.2 disk spigot	601-92

(a) Within F.C.S. limits. Accept.

- (3) Check No.8 Labyrinth seal fin diameter (F.C.S.601-83/84/85).

NOTE: Make these checks in conjunction with the Compressor Intermediate Case (Ref.72-32-00).

(a) Within F.C.S. limits. Accept.

- (4) Check No.6 and 7 labyrinth seal diameters (F.C.S.601-79/80/82).

NOTE: Make these checks in conjunction with the Compressor Intermediate Case (Ref.72-32-00).

(a) Within F.C.S. limits. Accept.

- (5) Check HP compressor thrust bearing diameter (F.C.S. 601-78).

NOTE: Make this check in conjunction with the Compressor Intermediate Case (Ref.72-32-00).

- (a) Within F.C.S. limits. Accept.

11. Inner Sealing Ring (302-270)

A. Inspect Ring.

- (1) Nicks, burrs and scores. Accept after repair.

(2) Wear.

- (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept.

(3) Rubbing.

- (a) Not more than 0.005 in. (0,130 mm) over not more than 90 degrees. Accept if F.C.S. limits are met.

B. Carry Out Dimensional Check.

- (1) Check fin diameter (F.C.S.601-161).

NOTE: Carry out this check in conjunction with the LP Drive Shaft Outer Sealing Ring (Ref. 72-31-04).

- (a) Within F.C.S. limits. Accept.

- (2) Check air tube diameter (F.C.S.601-163).

NOTE: Carry out this check in conjunction with the Air Transfer Tube (para.17).

- (a) Within F.C.S. limits. Accept.

12. Spacer Ring, Stages 2 to 3 (302-330)

A. Inspect HP2 Labyrinth Fins.

(1) Rubbing.

(a) Slight rubbing, within
F.C.S. limits.

Accept.

(2) Nicks and burrs.

Accept after repair.

(3) Damage to fin edges.

Accept after
repair, providing
that only one blend
is made to each fin,
that finished
blends are not more
than one-half fin
depth deep or five
times fin depth
long, that all
blends on adjacent
fins are separated
radially by not
less than five times
fin depth at their
ends, and that
F.C.S. limits are
not violated.

NOTE: Damage greater than this will require repair
(Ref.72-33-02 Repair No.5).

B. Inspect Stages 2 and 3 Rotor Disc Abutment Faces.

(1) Nicks, burrs and scores.

Accept, if repair
does not violate
F.C.S. limits.

C. Inspect Shouldered Bolt Locating Bores.

CAUTION: THE BOLT HOLE BORE IS A CRITICAL AREA.
(Ref.Fig.309). SPECIAL ATTENTION MUST
BE PAID TO THIS AREA FOR SIGNS OF DAMAGE
DURING THE GENERAL OVERALL INSPECTION.

(1) Wear.

(a) Smooth, unstepped wear,
within F.C.S. limits.

Accept.

OVERHAUL

E. Inspect Rokide Coating on Spacer Outer Diameter.

NOTE: Before commencing this inspection, examine edges of any chipping for adhesion of Rokide coating. Ensure that any suspect coating is removed before assessing damage.

(1) Measure and assess chip damage.

NOTE: In this paragraph, peripheral dimensions are measured round the circumference of the disk surface; axial dimensions are measured across the width of the spacer surface.

- | | | |
|-----|---|---------|
| (a) | Any chip more than 5 peripheral in. (127 peripheral mm) in length, regardless of width. | Reject. |
| (b) | Any chipping less than one third of spacer axial width and up to 10 in. (254 mm) peripheral length. | Accept. |
| (c) | Any areas of chipping acceptable under (a) and (b) and separated by not less than 10 in. (254 mm). | Accept. |
| (d) | Any number of chips not exceeding 10 per cent of the total coated area. | Accept. |

F. Inspect Front and Rear Rotor Disk Abutment Faces.

(1) Fretting.

- | | | |
|-----|---|--|
| (a) | Not deeper than 0.005 in. (0,130 mm) on either side; i.e. total acceptable rim loss is 0.010 in. (0,250 mm), provided fretting on either side does not exceed 0.005 in. (0,130 mm). | Accept, if repair does not violate these limits. |
|-----|---|--|

- | | | |
|-----|--------------------------|----------------------|
| (2) | Nicks, burrs and scores. | Accept after repair. |
|-----|--------------------------|----------------------|

- (2) Nicks and burrs. Accept after repair.
- (3) Damage to fin edges. Accept after repair, providing that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that all bleeds on adjacent fins are separated radially by not less than five times fin depth at their ends, and that F.C.S. limits are not violated.

NOTE: Damage greater than this will require repair (Ref.72-33-02 Repair No.3).

L. Carry Out Dimensional Checks.

- (1) Check the following shaft diameters and bores.

NOTE: Make these checks in conjunction with the appropriate mating items.

Location	F.C.S.
Stage 7 disk (dia.)	601-124
Shouldered bolts (bore)	601-125
No.12 labyrinth (both)	601-123/133
Air transfer tube (dia.)	601-134
No.4 bearing (dia.)	602-197
HP turbine hub (dia.)	602-198
Centering ring (dia.)	602-206
Nos.24 and 26 labyrinth (bore)	602-207

- (a) Within F.C.S. limits. Accept.

- (2) Check No.13, 14 and 15 seal fin diameters (Ref. F.C.S. 602-192/193/194).

NOTE: Make this check in conjunction with the HP Turbine Bearing Support (Ref.72-51-01).

(a) Within F.C.S. limits. Accept.

- (3) Check square dimensions of splines (Ref.72-09-00 Inspection/Check) (F.C.S. 601-202).

NOTE: Make this check in conjunction with the HP Turbine Hub (Ref.72-51-03).

NOTE: This item contains 87 splines pitched as for 88; with one spline removed at the master slot. Take dimensions from the centre line of spline roots.

(a) Any side of square outside F.C.S. limits. Reject.

(b) Within F.C.S. limits. Accept.

17. Air Transfer Tube (304-400)

A. Inspect HP Drive Shaft Location Bore.

- (1) Nicks, burrs and scores.

(a) Not more than 0.005 in. (0,130 mm) deep. Accept, if repair preserves F.C.S. limits.

B. Inspect Rotor Shaft Front Abutment Face and Location Diameter.

(1) Nicks and burrs. Accept after repair, provided F.C.S. limits are met.

HP COMPRESSOR DIFFUSER CASE ASSEMBLY - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.
 - (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

4. Tubes (302-80/210/340/420) (Ref.SB.72-84 and 72-137)

A. Inspect Tubes (Ref.72-09-00 Inspection/Check).

B. Inspect Tube Bores.

(1) Inspect tube bore for contamination using a flexible intrascope.

(a) Bore entirely free of contamination. Accept.

(b) Contamination present in bore. Reject for cleaning.

C. Inspect All Threads (Ref.72-09-00 Inspection/Check).

D. Inspect Tube End Nipples and Seatings.

(1) Inspect tube end seating faces.

(a) Scored or pitted. Reject.

(b) Sealing capability unimpaired. Accept.

E. Inspect Angled Adapter Block (302-340).

(1) Nicks and burrs. Accept after repair.

(2) Scores.

(a) Not more than 0.005 in. (0,130 mm) deep on sealing face. Accept after repair providing sealing capabilities are unimpaired.

5. Insulating Blanket (302-100/110/120/130/230/240/250/260/360/370/380/390/440/450)

A. Inspect Spot Weld.

(1) Damage.

OVERHAUL

- (a) Broken spot welded joints. Reject.

B. Inspect Blanket.

(1) Damage.

- (a) Tears and punctures. Reject.
(b) Small dents of smooth contour. Accept.
(c) Powdering and collapse of filler. Reject.

NOTE: Press blanket with finger tips and note any lack of "cushion" effect.

6. Union (302-400) (Ref.SB.72-82)

NOTE: Carry out this check in conjunction with the tube (302-340).

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Hexagon.

- (1) Nicks and burrs. Accept after repair.
(2) Scores.
(a) Not more than 0.005 in. (0,130 mm) deep on sealing face. Accept after repair providing sealing capabilities are unimpaired.

7. Flat Washer (303-20)

A. Inspect Washer.

- (1) Wear and fretting.
(a) Not more than 0.005 in. (0,130 mm) deep on the locking sleeve contact face. Accept after repair providing 100 per cent contact area is maintained.

INSPECTION/CHECK

72-34-00

Page 305

OVERHAUL

(2) Nicks and burrs.

Accept after
repair.

8. Locking Sleeve Spacer (303-30) Outer Sleeve (303-40) and Inner Sleeve (303-60)

A. Inspect Splines (Ref.72-09-00 Inspection/Check).

(1) Wear.

(a) Not more than 0.005 in.
(0,130 mm) on splines.

Accept after
repair.

(b) Backlash not exceeding
0.010 in. (0,250 mm) on
spline engagement.

Accept after
repair.

(2) Nicks and burrs.

Accept after
repair.

9. Labyrinth Seal No.12 (303-110)

A. Carry Out Dimensional Checks (Ref.72-34-00 Fits and Clearances F.C.S. 601-127/128/129/130/131/132).

NOTE: Worn dimensions quoted in Fits and Clearances in respect of seals to SB.72-8574-278 standard, apply across the full width of the seal but do not include local grooving.

(1) Carry out these checks in conjunction with the HP Compressor Rear Labyrinth (Ref.72-32-02).

(2) Remove any burrs or metal build-up prior to carrying out these checks.

B. Inspect Labyrinth Seal Housing Bore.

(1) Nicks and burrs.

Accept after
repair.

(2) Wear (pre SB.72-8574-278 standard).

(a) Damage greater than (b).

Accept after
repair (Ref.
72-34-00
Repair No.1).

(b) Any number of grooves,
provided that they are
all contained within an
arc not greater than
60 degrees of bore mean
circumference, that max-
imum depth is not greater

Accept.

TN12140

than 0.005 in. (0,130 mm)
and that F.C.S. limits are
not violated.

(3) Abradable coating (SB.72-8574-278 standard)

- | | | |
|-----|---|--|
| (a) | No signs of break-up
or excessive erosion. | Accept. |
| (b) | Clean cut grooves not
wider than 0.100 in.
(2,54 mm). | Accept. |
| (c) | Areas of chipping extending
across less than 25% of the
coating width and circumfer-
entially not exceeding 0.500
in. (12,70 mm) in collective
length. | Accept
provided that
base metal is
not exposed. |

(4) Distortion.

- | | | |
|-----|---|---------|
| (a) | Provided that minimum
local clearance is not
less than 0.006 in.
(0,150 mm) below the
minimum permissible
dimension in the F.C.S.
over an arc not greater
than 90 degrees. | Accept. |
|-----|---|---------|

10. Adjusting Ring (303-120 to 210 and 220 to 330)

NOTE: These items may require selection during assembly.

A. Inspect Abutment Faces.

- | | | |
|-----|--------------------------|---|
| (1) | Nicks, burrs and scores. | Accept, provided
that repair preserves
surface flatness and
that designed
effective thickness
is maintained over
90 per cent of
contact face area. |
| (2) | Fretting and wear. | Reject. |

11. Stepped Pin (304-10)

NOTE: Carry out this check in conjunction with the Diffuser Case 304-340 (Ref.para.16).

A. Inspect Pin.

(1) Security.

(a) Pin loose in diffuser case location. Reject.

(2) Damage.

(a) Bent. Reject.

(b) Nicks and burrs and slight dressable damage. Accept after repair.

12. Brackets (304-40/85)

A. Inspect Attachment Faces.

(1) Wear and fretting.

(a) Reduction of material thickness not more than 10 per cent. Accept.

(b) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

(2) Scoring.

(a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair providing material thickness is not reduced by more than 10 per cent.

B. Inspect Brackets.

(1) Nicks and burrs. Accept after repair.

(2) Distortion. Accept if compatibility is preserved.

13. Blanking Cover (304-90), Blank Cover and Thermocouple Housing (304-100) and Cover (304-250)

A. Inspect Covers.

(1) Distortion.

 - (a) Bolt holes elongated not more than 0.005 in. (0,130 mm). Accept.
- (4) Scores.
 - (a) Not more than 0.005 in. (0,130 mm) in depth and not extending across the sealing washer sealing lip location. Accept after repair.

B. Inspect Thermocouple Housing Thread (Ref.72-09-00 Inspection/Check).

NOTE: Carry out this check in conjunction with the Union Nut (304-190).

14. Blank (304-150/220)

A. Inspect Blanks.

- (1) Scores.
 - (a) Not more than 0.005 in. (0,130 mm) in depth on the abutment face. Accept after repair.
- (2) Nicks and burrs. Accept after repair.
- (3) Wear.
 - (a) Bolt holes elongated not more than 0.005 in. (0,130 mm). Accept after repair.

15. Union Nut (304-190)

A. Inspect Thread (Ref.72-09-00 Inspection/Check).

NOTE: Carry out this check in conjunction with cover (304-100).

16. Blank Ferrule (304-200)

A. Inspect Seating.

- (1) Wear.
 - (a) Light dressable wear. Accept providing sealing capabilities are preserved.

INSPECTION/CHECK

72-34-00

Page 309

OVERHAUL

(2) Scores.

- (a) Not more than 0.003 in.
(0,080 mm) deep.

Accept after repair
providing sealing
capabilities are
unimpaired.

17. Elbow (304-300)

A. Inspect Elbow.

- (1) Distortion.

Accept if compati-
bility is
maintained.

- (2) Nicks and burrs.

Accept after
repair.

- (3) Scoring.

- (a) Scoring at bolt head
locations not more than
0.005 in. (0,130 mm) deep.

Accept after
repair.

B. Inspect Seal Housing.

- (1) Nicks, burrs and scoring.

- (a) Of any description on
sealing lands.

Reject.

- (2) Fretting.

- (a) Light fretting not more
than 0.002 in. (0,050 mm)
in depth.

Accept after repair
providing sealing
capabilities are
preserved.

C. Inspect Flange Face.

- (1) Scores.

- (a) Not more than 0.005 in.
(0,130 mm) in depth and
not extending right
across the sealing face.

Accept after repair
providing sealing
capabilities are
unimpaired.

- (2) Nicks and burrs.

Accept after
repair.

(3) Wear.

- (a) Bolt holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

18. HP Compressor Diffuser Case (304-340)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Rokide Protective Finish.

NOTE: Check the Rokide coating around the edge of the chipped area for faulty adhesion. Remove any suspect areas and finally dress edges of Rokide around chipped areas before carrying out the following checks.

(1) Chipping.

- (a) Any area of chipping greater than 10 square inches (6450 square mm).

Reject for repair.

- (b) Any number of areas of chipping not exceeding a total of 20 square inches (12900 square mm) per coated region.

Accept.

C. Inspect Vane Ends Inner Seal Housings.

(1) Fretting.

- (a) Not more than 0.002 in. (0,050 mm) in depth.

Accept.

D. Inspect Stepped Pins in Fuel Sprayer Mountings.

NOTE: Carry out this check in conjunction with stepped pins 304-10 (Ref.para.9).

(1) Security.

- (a) Pin loose in case.

Reject case for salvage.

E. Inspect All Joint Faces.

(1) Nicks and burrs.

Accept after repair.

(2) Scoring.

- | | |
|---|-------------------------|
| (a) Not more than 0.005 in.
(0,130 mm) deep and not
extending right across
the sealing face. | Accept after
repair. |
|---|-------------------------|

(3) Fretting and wear.

- | | |
|-------------------------------|---------|
| (a) Any bolt holes elongated. | Reject. |
|-------------------------------|---------|

(4) Distortion.

- | | |
|---|---------|
| (a) Any distortion of the whole
or part of the case. | Reject. |
|---|---------|

F. Inspect Damper Ring.

- | | |
|---|---|
| (1) Damper ring in correct
axial position. | Accept. |
| (2) Damper ring under interference
with inner case. | Accept. |
| (3) Check for evidence of any
relative movement of the inner
case forward lip i.e. fretting,
burrs or overheating. | |
| (a) Any evidence of movement
or lack of interference | Accept, after
repair; refer to
SB.72-8728-287
(increased inter-
ference fit). |

G. Inspect Delivery Case Vanes.

(1) Dents.

- | | |
|--|---------|
| (a) Large irregular dents and
dents with impact marks. | Reject. |
| (b) Dents of smooth contour
not more than 2 per cent
of "normal" section
thickness. | Accept. |

COMBUSTION CHAMBER - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.
- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

4. Annular Combustion Chamber Assembly

A. Inspect Shanked Self-locking Nuts (Ref.72-09-00 Inspection/Check.

B. Inspect Outer Turbine Entry Duct Nozzle Location (Ref.Fig.303).

(1) Fretting and wear.

(a) Less than 0.020 in. Accept.
(0,500 mm) deep at
NGV locations.

C. Inspect Inner Turbine Entry Duct Nozzle Location (Ref.Fig.303).

(1) Fretting and wear.

(a) Light dressable amounts. Accept.

D. Inspect Front Fairing (Head Outer Surface) and Combustion Chamber Outer Surface.

(1) Metallic splatter.

(a) Less than 0.010 in. Dress locally to
(0,250 mm) deep. ensure that
surface is no
rougher than the
unsplattered
parent surface.

(b) Reduction in cooling Accept after repair
hole area or cooling (Ref.72-41-01,
holes blocked. Repair No.1 onwards).

E. Visual Check.

(1) Carry out complete visual Accept after repair
inspection in accordance (Ref.72-41-01,
with 72-09-00 Inspection/ Repair No.1 onwards).
Check.

COMBUSTION CHAMBER OUTER CASE - INSPECTION/CHECK1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards. Special attention must be paid to critical areas of certain specified items during inspection. An instruction to this effect is included in the inspection detailed for the specified item.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

HP TURBINE BEARING SUPPORT - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

4. Outer Air Duct (302-270)

A. Inspect Cover Unit Locating Bore.

NOTE: Carry out these checks in conjunction with the
Cover Unit (Ref.para.6).

(1) Check dimension of air duct inner bore (F.C.S.
602-234).

(a) Diameter within Accept.
F.C.S. limits.

(2) Fretting. Accept, if repair does
not violate F.C.S.
limits in (1).

(3) Nicks and burrs. Accept, if repair does
not violate F.C.S.
limits in (1).

B. Inspect Outer Air Duct Abutment Flange.

(1) Distortion.

(a) Square to centre line Accept.
with no distortion.

5. Coupling Assemblies (302-50/130/220 and 303-50)

A. Inspect Seal Ring Grooves.

NOTE: Carry out these checks in conjunction with new Seal Rings.

- (1) Check dimension of seal ring grooves (F.C.S. 601-182/184 for 305-20/220; F.C.S. 601-186/188 for 302-130; F.C.S. 601-180 for 303-50).

(a) Groove width within F.C.S. limits. Accept.

- (2) Nicks and burrs. Accept, if repair does not violate F.C.S. limits in (1).

B. Inspect Captive Self-locking Nuts and Retainers (Ref.72-09-00 Inspection/Check).

6. Cover Assembly (305-180)

A. Check No.13 Labyrinth Bore Dimensions.

- (1) Check bore (F.C.S. 602-192).

NOTE: Carry out this check in conjunction with the HP Rotor Shaft (Ref.72-33-02 Inspection/Check).

(a) Diameter within F.C.S. limits. Accept.

- (2) Nicks and burrs. Accept, if repair does not violate F.C.S. limits in (1).

B. Inspect Captive Nuts and Retainers (Ref.72-09-00 Inspection/Check).

C. Inspect No.13 Labyrinth Seal Housing Bore.

- (1) Overheating discolouration. Accept.

- (2) Nicks and burrs. Accept after repair.

(3) Grooving.

- (a) Damage greater than (b). Accept after repair (Ref. 72-51-01 Repair No.1 and No.5).
- (b) Any number of grooves, provided that they are all contained within an arc not greater than 60 degrees of bore mean circumference, that maximum depth is not greater than 0.005 in. (0,130 mm) and that F.C.S. limits are not violated. Accept.

(4) Distortion.

- (a) Provided that minimum local clearance is not more than 0.006 in. (0,150 mm) below the minimum permissible dimension in the F.C.S. Accept.

D. Carry out Dimensional Checks.

- (1) Check bore of air tube locations and duct/bore clearance (F.C.S. 601-243).

NOTE: Carry out this check in conjunction with the Tube Assemblies (para.9).

- (a) Within F.C.S. limits. Accept.

- (2) Check Outer Air Duct location diameter (F.C.S. 602-234) and Bearing Housing location bore (F.C.S. 602-190).

NOTE: Carry out these checks in conjunction with the Outer Air Duct (para.4) and the Bearing Housing (para.15).

(3) Scoring.

- (a) Less than 0.005 in. (0,130 mm) deep. Accept after repair.

- (4) Pick-up. Accept after repair.

E. Inspect Cover Assembly Bores.

- (1) Inspect cover assembly bores for contamination

- (a) Bores entirely free of Contamination. Accept.

- (b) Contamination present in bores. Reject for cleaning.

11. Tube Ends (304-210/260) and Adapter (304-240)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Tube Bores.

(1) Inspect tube bores for contamination.

(a) Bore entirely free of contamination. Accept.

(b) Contamination present in bore. Reject for cleaning.

C. Inspect Spherical Ends.

(1) Scores.

(a) Less than 0.005 in. (0,130 mm) deep. Accept, if repair preserves sealing capability.

(2) Fretting.

(a) Less than 0.001 in. (0,030 mm) deep. Accept, if repair preserves sealing capability.

(3) Nicks and burrs. Accept, if repair preserves sealing capability.

D. Carry Out Dimensional Checks on Tube Ends.

(1) Check seal gap in position (F.C.S. 601-244), seal ring and groove width and clearance (F.C.S. 601-245).

NOTE: Carry out this check in conjunction with the Cover Assembly (para.6) and identify acceptable ring for matching with compatible tube ends and cover.

(a) Within F.C.S. limits. Accept.

E. Inspect Tube Adapter Bore.

(1) Inspect tube adapter bore for contamination.

(a) Bore entirely free of contamination. Accept.

(b) Contamination present in bore. Reject for cleaning.

F. Carry Out Dimensional Check on Tube Adapter.

(1) Check diameter of tube end and clearance in Cover Assembly bore (F.C.S. 601-246).

23. Filter Assembly (304-215B) (SB.72-8800-311)

A. Inspect Nozzle Oilway.

NOTE: The diameter of the oilway is 0.092/0.094 in.
(2,34/2,39 mm).

(1) Check for damage.

(a) Any damage. Reject.

(2) Check for obstruction and contamination.

(a) Entirely free of obstruction and contamination. Accept.

(b) Obstructed or contamination present. Reject for cleaning and investigation.

B. Inspect Filter Element.

(1) Check for damage.

(a) Any damage. Reject.

(2) Check for obstruction and contamination.

(a) Entirely free of obstruction and contamination. Accept.

(b) Obstructed or contamination present. Reject for cleaning and investigation.

C. Inspect Abutment Face with Tube End.

(1) Scores.

(a) Less than 0.005 in. (0,13 mm) deep, not more than one third across face. Accept, if repair preserves sealing capability.

(2) Nicks and burrs. Accept, if repair preserves sealing capability.

HP TURBINE NOZZLES - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

4. Ring (302-10)

A. Inspect Nozzle Vane Locating Slots.

(1) Fretting.

(a) Not more than 0.005 in. (0,130 mm) deep.	Accept after repair.
---	-------------------------

5. Nozzle Vane Assemblies (302-40 - 30 off and 302-50/60 - 1 off each) (Ref.SB.72-64 and 72-124)

A. Inspect Locating Lug and All Abutment Faces (Ref.Fig.303).

(1) Fretting.

(a) Less than 0.002 in. (0,050 mm) deep.	Accept after repair.
---	-------------------------

B. Inspect Locking Pin Location (Ref.Fig.303).

(1) Fretting.

(a) Less than 0.002 in. (0,050 mm) deep.	Accept, if repair does not violate F.C.S. limits in (2).
---	---

(2) Check pin location width (F.C.S.601-240).

NOTE: Carry out this check in conjunction with the
Vane Locking Pins (Ref. Combustion Chamber
Outer Case 72-42-01 Inspection/Check).

(a) Within F.C.S. limits.	Accept.

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION No. 72-504

Insert in 72-51-02 Inspection/Check before Page 305

REASON FOR ISSUE:

To give frettage acceptance standards for H.P. N.G.V. liner tubes at the inner platform (MRA 47).

ACTION

Add a BEOL Note to Para. 5E to read:

BEOL NOTE: Frettage of the ends of the liner tube at the inner platform is acceptable without repair, up to the loss of 50% of the tube circumference.

OLYMPUS 593

MK.610-14-28
OVERHAUL

C. Inspect Rotor Blade Seal Faces (Ref.Fig.303).

(1) Rotor tip rub scores.

- | | |
|---|-------------------------|
| (a) Less than 0.015 in.
(0,380 mm) deep. | Accept after
repair. |
|---|-------------------------|

D. Inspect Pack Aluminizing.

(1) Chips and burrs.

- | | |
|--|--|
| (a) Any individual area
greater than 0.25 sq. in.
(40,3 sq. mm). | Reject for
touch-up
with Sermaloy J
(Ref.72-09-05
Repair). |
|--|--|

- (b) No individual area greater
than 0.25 sq. in.
(40,3 sq. mm).

- | | |
|---------------------------------------|--|
| (i) More than four
separate areas. | Reject for
touch-up
with Sermaloy J
(Ref.72-09-05
Repair). |
|---------------------------------------|--|

- | | |
|--|---------|
| (ii) Up to four separate
areas, none less than
0.5 in. (12,7 mm)
apart. | Accept. |
|--|---------|

(2) Hair-line cracks.

- | | |
|--|-------------------------------|
| (a) Parent material
penetrated. | Reject, subject to
para.E. |
| (b) Pack aluminizing only
affected. | Accept. |

E. Inspect Vane Liners.

- | | |
|-----------------|---|
| (1) Any damage. | Accept after repair
(Ref.72-51-02
Repair No.2). |
|-----------------|---|

F. Inspect Vane Aerofoils (Ref.Fig.303).

NOTE: Crack length to be taken as "straight line"
distance between extremities, regardless of
crack path.

NOTE: Unshaded area is measured vertically from
platform surface.

INSPECTION/CHECK

NOTE: Nozzle vane assemblies which have been subject to braze repairs of the vane aerofoil on two previous occasions, should not be accepted for further repair. A third braze repair may be carried out if the vane aerofoil cracks are within the limits detailed in para 5.F.(1).

(1) Aerofoil cracks.

- | | |
|---|------------------------|
| (a) Less than 0.010 in.
(0,25 mm) wide and
0.500 in. (12,70 mm)
in length. Not less
than 0.500 in.
(12,70 mm) from any
adjacent cracks. | Accept after
repair |
|---|------------------------|

(2) General Cracks.

- | | |
|--|--------------------|
| (a) More than one crack per
vane, regardless of
location and length, and
contained with the
unshaded zone i.e. the
area measured 0.250 in.
(6,35 mm) vertically from
the under surface of the
outer platform and
extending across the vane. | Reject for repair. |
| (b) A crack wholly or
partly within shaded zone. | Reject for repair. |
| (c) A crack extending into
platform (but excluding
fillet radius). | Reject for repair. |
| (d) A crack extending more
than 0.50 in. (12,7 mm)
from trailing edge,
contained with the
unshaded zone. | Reject for repair. |
| (e) A crack, extending to
within 0.50 in. (12,7 mm)
of leading edge, or
1.00 in. (25,4 mm) of
trailing edge, contained
within the unshaded zone. | Reject for repair. |

- (3) Any other damage (except pack aluminizing - para.D). Reject.

6. Adjusting Washers (302-90 to 135 and 250 to 315) (Pre SB.72-86)

NOTE: Refer to 72-51-01 for SB.72-86 standard.

NOTE: These items may require selection during assembly.

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores.

Accept, provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

- (2) Fretting and wear.

Reject.

7. Nozzle Vane Support Cone (302-150)

A. Inspect Vane Locating Groove.

- (1) Fretting.

- (a) Tapering to not more than 0.005 in. (0,130 mm) deep on sloping face; light witness mark only on locating diameter.

Accept after repair.

B. Inspect Shouldered Locating Pins (302-70 - 12 off).

- (1) Damage and security.

- (a) Any damage or any insecure pins.

Reject.

C. Inspect Abutment Faces.

- (1) Nicks and burrs.

Accept, if repair preserves surface flatness.

D. Inspect Bolt Locations.

- (1) Wear and fretting.

- (a) Bolt holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

8. Labyrinth Retaining Plate (302-200)

A. Inspect Extraction Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Bolt Locations.

(1) Wear and fretting.

- (a) Bolt holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

C. Inspect Abutment Faces.

(1) Nicks and burrs.

Accept, if repair preserves surface flatness.

9. Labyrinth Housing (302-210)

A. Inspect Labyrinth Housing Bores.

(1) Security and distortion of seal rings.

- (a) Any insecurity or distortion.

Reject.

(2) Nicks and burrs.

Accept after repair.

(3) Grooving.

- (a) Any damage greater than (b).

Accept after repair (Ref. 72-51-02 Repair No.1).

- (b) Any number of grooves, provided that they are all contained within an arc not greater than 60 degrees of bore mean circumference, that maximum depth is not greater than 0.005 in. (0,130 mm) and that F.C.S. limits are not violated.

Accept.

INSPECTION/CHECK

(4) Distortion.

- (a) Provided that minimum local clearance is not more than 0.006 in. (0,150 mm) below the minimum permissible dimension in the F.C.S.

Accept.

B. Inspect Abutment Faces.

- (1) Nicks and burrs.

Accept, if repair preserves surface and does not violate F.C.S. limits.

C. Inspect Bolt Locations.

- (1) Wear and fretting.

- (a) Bolt holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

D. Carry Out Dimensional Checks.

- (1) Check Nos.19, 20, 21 and 22 labyrinth seal bores and clearances (F.C.S. 601-203/204/208/209).

NOTE : Carry out these checks in conjunction with the HP Turbine Rotor (Ref.72-51-03 Inspection/Check).

- (a) Within F.C.S. limits.

Accept.

- (2) Check Shroud Unit location diameter and clearance (F.C.S. 601-232).

NOTE : Carry out this check in conjunction with the Shroud Assembly (Ref.72-51-01 Inspection/Check).

- (a) Within F.C.S. limits.

Accept.

10. Sealing Strips (302-45/47/55/57/65/67) (SB.72-124)

A. Inspect Strips.

- (1) Any damage.

Reject.

HP TURBINE ROTOR - INSPECTION/CHECK1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards. Special attention must be paid to critical areas of certain specified items during inspection. An instruction to this effect is included in the inspection detailed for the specified item.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

ATP TEMPORARY REVISION

British airways

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No.0-2

Dennis Howard

For Chief Technical and Industrial Services Engineer CAA Design Approval No.DAI/8566/78

TEMPORARY REVISION NO.72-567

Insert in 72-51-03 after page 304

REASON FOR ISSUE

BEOL NOTE added

ACTION

Read the following NOTE after paragraph 4 heading:-

BEOL NOTE:

Where blades belonging to British Airways are divorced for any reason from the O9 module in which they arrived at BEOL, they are to be life marked by vibro peening using the following coding table. The life in hours is to be obtained by reference to the module log card in conjunction (if applicable) to the previous H.P. turbine blade build life record sheet. Individual reference to blades on the blade build sheet is possible due to the unique serial numbering of the blades. The marking is to be confined to the area on the underside of the inner platform concave side.

A 0-100	J 801-900	R 1,601-1,700

OVERHAUL

- (d) Cracks in the bridge piece Accept.
 braze at the notch corner
 and on the underside of
 the shroud along the short
 braze face but not extend-
 ing into the long braze
 face and not extending
 into any parent metal.

- (2) Distortion of outer shroud platform.

- (a) Trailing edge of platform Accept.
 distorted but remains
 convex or flat.

- (3) Distortion of bridge piece and underlying shroud
 metal (Pre SB 72-8692-260 standard).

NOTE: To check the bridge piece for distortion place
 a straight edge diagonally across the bridge
 piece i.e. corner to corner. Using feeler
 gauges check the gap between the straight edge
 and the bridge piece at the centre of each
 diagonal as follows:

- (a) Flatness on the short Accept.
 diagonal, i.e. from
 leading edge notch
 radius to trailing
 edge notch radius,
 within 0.005 in.
 (0,13 mm).

- (b) Flatness on the long Accept.
 diagonal, i.e. from
 leading edge corner
 to trailing edge
 corner, within
 0.010 in. (0,25 mm).

- (4) Distortion of bridge piece and underlying shroud
 metal (SB 72-8692-260 standard).

NOTE: To check the bridge piece for distortion place
 a straight edge across the upper surface along
 the long diagonal from the leading edge corner
 to the trailing edge corner.

- (a) Bridge piece distorted Accept.
 but upper surface
 remains flat or convex.

(5) Overheating.

- (a) Obvious burning, erosion, deposition of material or damage to pack-aluminising. Reject.
- (b) Reported or suspected high temperature indication.
- (i) Select one blade from set for laboratory examination.
- (ii) Machine two 1.00 x 0.040 in. (25,4 x 10,2) wide sections from the trailing edge of the blade, extending from 1.375 to 3.375 in. (34,9 to 85,7) above the root platform. Machine one radial section from the blade. Refer to Fig.304. Use an elastic slitting wheel for these operations, with adequate cooling.
- (iii) Mount the sections in an appropriate mounting compound (e.g. Bakelite). The trailing edge sections must be mounted such that the concave surface may be metallographically prepared. Mount the root section on the cut face.
- (iv) Grind and polish the sections. The trailing edge sections must be ground sufficiently to remove the aluminide coating and its diffusion zone.

INSPECTION/CHECK

E. Hardness Check.

- (1) If the turbine items have been returned for inspection due to overheating (or suspected overheating), carry out a hardness test on the turbine disk as follows.
 - (a) Use an abrasive to smooth the surface of the disk at four equally spaced positions, on each side of the disk, between the blade root locations (Ref. Fig.308).
 - (b) Test the hardness, at the smoothed areas of the disk, using a 5 kg load. The disk is acceptable provided that:
 - (i) The hardness value at all the positions tested is greater than 350 HV.
 - (ii) The difference between the maximum and minimum values at the eight positions tested is less than 20 HV.
 - (iii) The hardness values at the four positions tested on the front face of the disk are not consistently different from those on the rear face.
- (2) All test results whether or not they meet the acceptable hardness values, should be forwarded together with the disk serial No. to CESO, Rolls-Royce plc, Bristol.

F. Inspect for Corrosion.

- | | |
|---|---|
| <ol style="list-style-type: none">(1) Carry out visual and binocular inspections. Identify any areas of corrosion pitting or areas of adherent oxide. | Submit details to Rolls-Royce plc for individual assessment |

HP TURBINE ROTOR - HUB AND LABYRINTH ASSEMBLIES -
INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards. Special attention must be paid to critical areas of certain specified items during inspection. An instruction to this effect is included in the inspection detailed for the specified item.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack tested by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS
302	35	Adjusting Washer	MP1

Items to be Magnetic Particle Crack Tested
Table 301

B. Fluorescent Dye Crack Detection.

- (1) Submit the items listed in Table 302 to crack detection in accordance with the process quoted. For details of the processes, refer to 72-09-00 Inspection/Check.

Items marked with an asterisk (*) in Table 302 feature defined critical areas. (Ref.Fig.304). In addition to the general overall crack detection examination, special attention must also be paid to these defined critical areas during the inspection.

CAUTION: THIS IS A ROTATING ASSEMBLY. ENSURE THAT ANY FREE OR CAPTIVE SELF-LOCKING NUTS (REGARDLESS OF SIZE) HAVE BEEN REPLACED BEFORE THE ASSEMBLY IS RELEASED FOR SERVICE (REF.72-09-00 INSPECTION/CHECK). FAILURE TO DO SO MAY RESULT IN ENGINE DAMAGE.

NOTE: Inspect all balancing weights (302-200) for general condition. Reject any damaged weight; any attempt at repair will render the weights suspect for balancing purposes. Retain any undamaged weights for possible selection and use during assembly.

4. Labyrinth Seal Rings (302-160/250)

CAUTION: SEAL RING 302-250 IS BALANCED WITH A DAMPER RING IN POSITION. IF SEAL AND DAMPER RING ARE SEPARATED PRIOR TO INSPECTION, COMPLETE INSPECTION OF SEAL RING AS DETAILED SUBSEQUENTLY, BUT DO NOT RELEASE EITHER ITEM FOR USE UNTIL ASSEMBLED, RE-BALANCED AND SUBJECTED TO RE-INSPECTION.

A. Inspect Labyrinth Seal Fins.

- (1) Overheating discolouration. Reject.
- (2) Rubbing.
 - (a) Slight rubbing within F.C.S. limits. Accept.

OVERHAUL

(3) Nicks and burrs.

Accept after repair.

(4) Damage to fin edges.

Accept after repair, providing that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that all blends on adjacent fins are separated radially by not less than five times fin depth at their ends, and that F.C.S. limits are not violated.

NOTE: Greater damage will require repair
(Ref.72-51-04 Repair No.1, 2, 4 and 5).

B. Inspect Rotor Disk Location Diameter and Turbine Hub Abutment Face (302-250).

(1) Scoring.

(a) Not more than 0.005 in. (0,130 mm) deep at face, or 0.002 in. (0,050 mm) at locating diameter. Accept if repair does not violate F.C.S. limits.

(2) Fretting.

(a) Not more than 0.002 in. (0,050 mm) deep at disk locating diameter. Accept if repair does not violate F.C.S. limits.

(3) Nicks and burrs.

Accept after repair.

C. Inspect Rotor Disk Locating Bore, Rotor Shaft Locating Diameter and Disk Abutment Face (302-160).

(1) Scoring.

(a) Not more than 0.005 in. (0,130 mm) deep at face or 0.002 in. (0,050 mm) at locating bore; not more than 0.001 in. (0,030 mm) at locating diameter. Accept if repair does not violate F.C.S. limits.

5. Externally Relieved Body Bolts - 10 Off (302-180)

NOTE: Before inspecting externally relieved body bolts check all bolts are identified with the letter 'T' on the threaded end of the bolt (Ref. S.B.72-87).

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Check Bolts for Bowing (Ref.Fig.303).

(1) Support bolt on locating diameters; set indicator to location diameter below bolthead. Rotate bolt and record total indicator reading (TIR).

(a) TIR not more than Accept.
0.015 in. (0,381 mm).

C. Inspect Bolt Location Diameters.

(1) Damage.

(a) Light contact marks Accept.
only.

D. Inspect Circlip Grooves.

(a) Light contact marking Accept.
only.

6. Turbine Hub (302-300)

CAUTION: HUB UNITS HAVE A CENTERING RING SHRUNK INTO INNER-MOST BORE OF DISHED FACE; BOTH ITEMS ARE BALANCED TOGETHER AS AN ASSEMBLY. IF CENTERING RING IS NOT IN POSITION, INSPECT HUB AS DETAILED SUBSEQUENTLY, BUT DO NOT RELEASE FOR USE UNTIL CENTERING RING HAS BEEN REFITTED OR REPLACED AND ASSEMBLY HAS BEEN RE-BALANCED AND SUBJECTED TO RE-INSPECTION.

A. Inspect Hirth Serration Flanks.

CAUTION: THE HIRTH SERRATIONS ARE A CRITICAL AREA. (Ref. Fig.304). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

INSPECTION/CHECK

(1) Fretting.

(a) Identify original machining witness mark; measure crests and troughs of any fretting.

(i) Not more than 0.001 in. (0,030 mm) above and below witness mark. Accept.

B. Inspect Nos.16 to 22 Seal Fins.

(1) Overheating discolouration. Reject.

(2) Rubbing.

(a) Slight rubbing within F.C.S. limits. Accept.

(3) Nicks and burrs. Accept after repair.

(4) Damage to fin edges. Accept after repair, providing that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that all blends on adjacent fins are separated radially by not less than five times fin depth at their ends, and that F.C.S. limits are not violated.

NOTE: Damage greater than this will require repair (Ref.72-51-04 Repair No.3).

C. Inspect Splines.

CAUTION: THE SPLINES ARE A CRITICAL AREA. (Ref.Fig.304). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

(1) Nicks and burrs. Accept after repair.

(2) Fretting on flanks.

- (a) Not more than 0.001 in. Accept, providing F.C.S. (0,030 mm) above or limits are not violated. below machining witness mark.

D. Inspect Location Bores for Rotor Shaft and Centering Ring (See CAUTION).

- (1) Nicks and burrs. Accept, if repair does not violate F.C.S. limits.

E. Inspect Bolt Location Bores.

CAUTION: THE BOLT HOLE BORES ARE A CRITICAL AREA. (Ref.Fig.304). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

NOTE: Examine the hub and check that a letter T is marked adjacent the Part No. If the letter T is not present, and the hub life is between 500 and 2250 cycles, the hub must be crack tested to the F3A process and examined for cracks at all areas adjacent the bolt-holes (Ref. S.B.72-8673-240).

(1) Cracks.

- (a) Any cracks. Reject.

(2) Scores.

- (a) Any scoring at bolt land locations. Reject.

F. Carry Out Dimensional Checks.

(1) Check drive shaft location bore (F.C.S.601-198).

NOTE: Make this check in conjunction with the HP compressor drive shaft (Ref.72-33-02).

- (a) Within F.C.S. limits. Accept.

INSPECTION/CHECK

- (2) Check No.16, 17, 18, 19, 20, 21 and 22 labyrinth fin diameters (F.C.S.601-199/200/201/203/204/208 and 209).

NOTE: Make these checks in conjunction with the HP turbine bearing support (Ref.72-51-01) and the HP nozzles (72-51-02).

(a) Within F.C.S. limits. Accept.

- (3) Check square dimensions of splines (Ref.72-09-00 Inspection/Check) (F.C.S. 601-202).

NOTE: Make this check in conjunction with the HP compressor drive shaft (Ref.72-33-02).

NOTE: Dimensional check should be carried out by identifying splines at the adjusting washer location end.

NOTE: This item contains 87 splines, pitched as for 88 with one uncut at master spline.

(a) Any side of square outside F.C.S. limits. Reject.

(b) Within F.C.S. limits. Accept.

- (4) Check centering ring bore (F.C.S.601-206).

NOTE: See CAUTION. If centering ring not fitted, check locating bore in hub (F.C.S.601-205).

NOTE: Make this check in conjunction with the HP compressor drive shaft (Ref.72-33-00). If centering ring is not fitted, check also replacement centering ring diameter (F.C.S.601-205).

(a) Within F.C.S. limits. Accept.

G. Inspect for Corrosion.

- (1) Carry out visual and binocular inspections. Identify any areas of corrosion pitting or areas of adherent oxide.

Submit details to Rolls-Royce plc for individual assessment

7. Centering Ring (Not Illustrated)

NOTE: This item is shrunk into centre bore of turbine hub (para.6). Observe CAUTION at head of para.6 if centering ring has been displaced or dislodged from hub, and inspect as detailed. If in position, follow para.6.F.(4).

A. Inspect Locating Faces and Bore.

- (1) Nicks, burrs and scores. Accept, if repair does not violate F.C.S. limits.

B. Carry Out Dimensional Checks.

NOTE: Make this check in conjunction with the turbine hub (para.6) and HP compressor drive shaft (Ref. 72-33-00).

- (1) Check locating diameter and bore (F.C.S. 601-205 and 601-206).

(a) Within F.C.S. limits. Accept.

8. Adjusting Washer (302-35)

NOTE: This item may require selection during assembly.

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores. Accept, provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

(2) Fretting and wear. Reject.

9. HP Turbine Hub Securing Nut (302-10)

A. Inspect Threads (Ref. 72-09-00 Inspection/Check).

B. Inspect Silver Plating.

- (1) Any damage more than minor pitting or scratches. Reject for re-plating (Ref.72-09-08, Repair).

NOTE: Because of the difficulty in ascertaining the presence of silver plate it is recommended that this nut is re-plated at every overhaul.

C. Inspect Spanner Locations.

(1) Damage.

- (a) Any damage that may affect tool operation or safety. Reject.
- (b) Any other minor damage. Accept after repair.

LP TURBINE NOZZLES - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

4. Cover Assembly (302-10)

A. Inspect Tube Attachment Welds.

(1) Cracks. Reject.

B. Inspect Abutment Face and Support Diaphragm Location
Diameter.

(1) Nicks, burrs and scores. Accept after
repair if F.C.S.
limits are not
violated.

C. Inspect Bolt Locations.

(1) Wear and fretting.

(a) Bolt-holes elongated not more than 0.030 in.
(0,760 mm); thickness
not reduced more than
5 per cent. Accept.

D. Inspect Thermocouple Probe Shields.

(1) Nicks and Burrs. Accept after
repair.

(2) Distortion. Reject.

(3) Fretting. Reject.

E. Carry Out Dimensional Check.

- (1) Check the support diaphragm location bore
(F.C.S.601-238).

NOTE: Make this check in conjunction with the
support diaphragm (para.7).

(a) Within F.C.S. limits. Accept.

5. Retaining Plates - 6 off (302-70)

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores. Accept after
repair.

B. Inspect Bolt Locations.

- (1) Wear and fretting.

(a) Bolt-holes elongated not Accept.
more than 0.030 in.
(0,760 mm); thickness
not reduced more than
5 per cent.

6. Nozzle Vanes - 13 off (302-80), - 8 off (302-90), - 1 off
(302-100), - 2 off (302-110)

A. Inspect All Locating Faces (Ref.Fig.303).

- (1) Fretting.

(a) Not more than 0.002 in. Accept.
(0,050 mm) on outer
location and platform
faces; tapering to not
more than 0.010 in.
(0,250 mm) on front and
rear diaphragm location
faces.

B. Inspect Thermocouple Probe Tubes.

- (1) Security.

(a) Tube secure in location. Accept.

OVERHAUL

NOTE: The unshaded area on the vane defined in Figure 303 is measured vertically from the platform surface.

NOTE: Nozzle vane assemblies which have been subject to braze repairs of the vane aerofoil on two previous occasions, should not be accepted for further repair. A third repair may be carried out if the vane aerofoil cracks are within the limits detailed in para.6.E.(1).

(1) Aerofoil cracks

- | | |
|---|------------------------|
| (a) Less than 0.010 in.
(0,25 mm) wide and
0.500 in. (12,70 mm)
in length. Not less
than 0.500 in.
(12,70 mm) from any
adjacent cracks. | Accept after
repair |
|---|------------------------|

(2) General Cracks.

- | | |
|---|--------------------|
| (a) More than one crack,
or one crack greater than
0.125 in. (3,180 mm) in
length, per vane at
concave surface vent hole. | Reject for repair. |
| (b) More than one crack per
vane contained within the
unshaded zone i.e. the
area measured 0.500 in.
(12,70 mm) vertically from
the under surface of the
outer platform and extend-
ing across the vane. | Reject for repair. |
| (c) A crack extending more than
1.125 in. (28,350 mm) from
the trailing edge of left-
hand vane, contained within
the unshaded zone. | Reject for repair. |
| (d) A crack extending more than
0.750 in. (19,050 mm) from
the trailing edge of right-
hand vane, contained within
the unshaded zone. | Reject for repair. |

7. Nozzle Vane Support Diaphragm (302-120)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect No.24 and 25 Labyrinth Seal Bores.

(1) Security and distortion
of seal rings.

(a) Any insecurity or distortion. Reject.

(2) Grooving.

(a) Any damage greater than (b). Reject.

(b) Any number of grooves, provided that they are all contained within an arc not greater than 60 degrees of bore mean circumference, that maximum depth is not greater than 0.005 in. (0,130 mm) and that F.C.S. limits are not violated. Accept.

(3) Fretting.

(a) Any amount, around total housing circumference. Accept if F.C.S. limits are not violated.

(b) Local fretting, extending over a total arc of not more than 60 degrees and not greater than 0.005 in. (0,130 mm) deep. Accept.

(4) Distortion.

(a) Provided that minimum local clearance is not more than 0.006 in. (0,150 mm) below the minimum permissible dimension in the F.C.S. Accept.

OVERHAUL

C. Inspect Cover Abutment and Spigot Locating Faces.

- (1) Nicks, burrs and scores.

Accept after
repair if F.C.S.
limits are not
violated.

D. Inspect Bolt Locations.

- (1) Wear and fretting.

- (a) Bolt-holes elongated
not more than
0.030 in. (0,760 mm);
thickness not reduced
more than 5 per cent.

Accept.

E. Inspect Nozzle Vane Location Faces (Ref.Fig.306).

- (1) Wear of rear location face.

- (a) Not greater than 0.020 in.
(0,500 mm) deep.

Accept.

- (2) Fretting of front location hook flanks (Ref.Fig.306).

- (a) Fretting on any flank with
a local depth greater than
0.050 in. (1,270 mm).

Reject.

- (b) Fretting greater than
0.005 in. (0,130 mm) in
depth and covering more
than 50 per cent of the
total flank area of any
one segment.

Reject.

- (c) Not more than 8 segments
with localised fretting
on either flank greater
than 0.030 in. (0,760 mm)
in depth but not more
than 0.050 in. (1,270 mm).

Accept.

OVERHAUL

F. Inspect Vane Location Segments.

(1) Fretting.

- | | |
|---|-------------------------|
| (a) Not more than 0.030 in.
(0,760 mm) on one side
only of locating dogs. | Accept. |
| (b) Fretting at thermocouple
probe bore. | Accept after
repair. |

G. Inspect Air Seal Fin.

(1) Damage.

- | | |
|------------------|--|
| (a) Edge damage. | Accept after repair,
provided that damage
is carefully blended
to remove burrs, is
confined to not more
than 30% of fin
perimeter, and maximum
depth is not greater
than 0.010 in. (0,25
mm). |
|------------------|--|

H. Carry Out Diaphragm Distortion Checks (Ref.Fig.305 and 306).

(1) Check vane location segment
diameter.

NOTE: Station 1, at engine vertical centre-line,
can be identified by TOP engraved on face F.

- (a) Measure and record
diameter A between
stations 1-5, 2-6,
3-7 and 4-8. Note and
record maximum deviation
from nominal diameter of
24.620 in. (625,350 mm).

- | | |
|---|---|
| (i) Maximum deviation
greater than plus
0.030 in. (0,760 mm)
or minus 0.050 in.
(1,270 mm). | Reject for repair
and crack test. |
| (ii) Maximum deviation
not more than in
(i). | Accept, if dis-
tortion wave check
is satisfactory
(para.(2)). |

OVERHAUL

(2) Check wave distortion on face C.

(a) Support diaphragm at three equi-spaced points on face B; use matched rollers.

(b) Identify station 1 at face C. Set dial test indicator at zero on outer edge of face C at station 1.

(c) Record total indicator readings (T.I.R.) on outer edge of face C at stations 2 to 8 inclusive.

(i) Any T.I.R. more than 0.015 in. (0,380 mm).

Reject.

(ii) No T.I.R. greater than 0.015 in. (0,380 mm).

Accept, subject to satisfactory vane location diameter check (para.(1)).

J. Carry Out Dimensional Checks.

(1) Check cover assembly location bore (F.C.S.601-238).

NOTE: Make this check in conjunction with the cover (para.4).

(a) Within F.C.S. limits.

Accept.

(2) Check No.24 and 25 labyrinth seal bores (F.C.S.601-228/229).

NOTE: Make these checks in conjunction with the HP and LP turbine rotors (Ref.72-51-03 and 72-52-02).

(a) Within F.C.S. limits.

Accept.

LP TURBINE ROTOR - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards. Special attention must be paid to critical areas of certain specified items during inspection. An instruction to this effect is included in the inspection detailed for the specified item.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack tested by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS
302	130	Retaining Nut	MP1
302	140	Bearing Inner Track	MP1
303	10	Retaining Nut	MP1

Items to be Magnetic Particle Crack Tested
Table 301

B. Fluorescent Dye Crack Detection.

- (1) Submit the items listed in Table 302 to crack detection in accordance with the process quoted. For details of the processes, refer to 72-09-00 Inspection/Check.

Items marked with an asterisk (*) in Table 302 feature defined critical and sensitive areas. (Ref.Figs.309 and 310). In addition to the general overall crack detection examination, special attention must also be paid to these defined critical and sensitive areas during the inspection.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS
302	100	Labyrinth Ring	F2A
302	110	Labyrinth Housing	F2A

CAUTION: THIS IS A ROTATING ASSEMBLY. ENSURE THAT ANY FREE OR CAPTIVE SELF-LOCKING NUTS (REGARDLESS OF SIZE) HAVE BEEN REPLACED BEFORE THE ASSEMBLY IS RELEASED FOR SERVICE (REF.72-09-00 INSPECTION/CHECK). FAILURE TO DO SO MAY RESULT IN ENGINE DAMAGE.

NOTE: Inspect all balancing weights (302-30/160) for general condition. Reject any damaged items; any attempt at repair will render them suspect for balancing purposes. Retain any undamaged items for possible selection and use during assembly.

4. Labyrinth Ring (302-100)

A. Inspect No.25 Labyrinth Seal Fins.

- | | |
|--|----------------------|
| (1) Overheating discolouration. | Reject. |
| (2) Rubbing. | |
| (a) Slight rubbing within F.C.S. limits. | Accept. |
| (3) Nicks and burrs. | Accept after repair. |

TN36006

INSPECTION/CHECK

72-52-02

Page 304

Apr 1/77

(4) Damage to fin edges.

Accept after repair, providing that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that blends on adjacent fins are separated radially by not less than five times fin depth at their ends, and that F.C.S. limits are not violated.

Note: Greater damage will require repair (Ref.72-52-02 Repair No.2 and 8).

B. Inspect Disk and Laybrinth Housing Abutment Faces.

(1) Scoring.

(a) Not more than 0.005 in. (0,130 mm) deep. Accept after repair.

(2) Nicks and burrs. Accept after repair.

C. Inspect Bolt Locations.

(1) Wear and fretting.

(a) Balancing bolt holes elongated not more than 0.030 in. (0,760 mm), light witness mark only at shouldered bolt locations. Accept.

(2) Scores.

(a) No scores at bolt land locations. Accept.

INSPECTION/CHECK

72-52-02

Page 305

OVERHAUL

D. Carry Out Dimensional Checks.

- (1) Check No.25 seal fin diameters (F.C.S.601-228).

NOTE: Make this check in conjunction with the LP Turbine Nozzles (Ref.72-52-01).

- (a) Within F.C.S. limits. Accept.

5. Labyrinth Housing (302-110)

A. Inspect Nos.26A and 26B Labyrinth Seal Bores.

- (1) Grooving.

- (a) Any damage greater than (b). Accept after repair (Ref. 72-52-02 Repair No.3).

- (b) Any number of grooves, provided that they are all contained within an arc not greater than 60 degrees of bore mean circumference, that maximum depth is not greater than 0.005 in. (0,130 mm) and that F.C.S. limits are not violated. Accept.

- (2) Fretting.

- (a) Any amount, around total housing circumference. Accept if F.C.S. limits are not violated.

- (b) Local fretting, extending over a total arc of not more than 60 degrees and not greater than 0.005 in. (0,130 mm) deep. Accept.

INSPECTION/CHECK

(3) Distortion.

- (a) Provided that minimum local clearance is not more than 0.006 in. (0,150 mm) below the minimum permissible dimension in the F.C.S. Accept.

B. Inspect Disk/Labyrinth Ring Abutment Faces and Hub/Cooling Air Duct Location Bores.

(1) Scoring.

- (a) Not more than 0.005 in. (0,130 mm) deep. Accept, if repair preserves F.C.S. limits.

(2) Nicks and burrs.

Accept, if repair preserves F.C.S. limits.

C. Inspect Bolt Locations.

(1) Wear and fretting.

- (a) Bolt holes elongated not more than 0.030 in. (0,760 mm); flange thickness not reduced more than 5 per cent. Accept.

(2) Nicks and burrs.

- (a) Small edges burrs. Accept after repair.

(3) Scores.

- (a) Any scoring at bolt land locations. Reject.

D. Carry Out Dimensional Checks.

- (1) Check Nos.26A and 26B labyrinth seal bores (F.C.S.601-211 and 212).

NOTE: Make this check in conjunction with the HP Turbine Rotor (Ref.72-51-03).

- (a) Within F.C.S. limits. Accept.

INSPECTION/CHECK

72-52-02

OVERHAUL

- (2) Check cooling air duct and turbine disk location bores (F.C.S.601-213 and 214).

NOTE: Make these checks in conjunction with the Cooling Air Duct (para.9) and LP Turbine Rotor Disk (para.13).

(a) Within F.C.S. limits. Accept.

6. Externally Relieved Body Bolts - 10 off (302-120)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Check Bolts for Bowing (Ref.Fig.306).

- (1) Support bolt on central waisted portion; set indicator to location diameter below bolthead. Rotate bolt and record total indicator reading (TIR).

(a) TIR not more than 0.005 in. (0,127 mm). Accept.

C. Inspect Bolt Locating Lands.

- (1) Wear and fretting.

(a) Light contact marks only. Accept.

7. Retaining Nut (302-130 and 303-10)

A. Inspect Threads (Ref.72-09-00) Inspection/Check).

B. Inspect Silver Plating.

- (1) Any damage more than minor pitting or scratches. Reject for re-plating (Ref.72-09-08, Repair).

NOTE: Because of the difficulty in ascertaining the presence of silver plate it is recommended that these nuts are re-plated at every overhaul.

OVERHAUL

C. Inspect Spanner Locations.

(1) Damage.

(a) Any damage that may affect tool operation or safety. Reject.

(b) Any other minor damage. Accept after repair.

8. Bearing Inner Track (302-140)

A. Inspect Track (Ref.72-09-00 Inspection/Check).

NOTE: Carry out this inspection in conjunction with the LP Turbine Bearing (Ref.72-52-03).

B. Carry Out Dimensional Check.

(1) Check bearing inner track bore (F.C.S.601-221).

NOTE: Carry out this check in conjunction with the Hub Assembly (para.10).

(a) Within F.C.S. limits. Accept.

9. Cooling Air Duct (302-200)

A. Inspect Duct Walls (Ref.72-09-00 Inspection/Check - Rigid Tubes).

(1) Distortion. Accept after repair if concentricity and profile are maintained.

B. Inspect Abutment Faces and Locating Diameters.

(1) Nicks and burrs; scores not greater than 0.005 in. (0,130 mm) deep. Accept after repair if F.C.S. limits are preserved.

(2) Wear and fretting.

(a) Not more than 0.002 in. (0,050 mm) deep. Accept after repair if F.C.S. limits are preserved.

INSPECTION/CHECK

72-52-02

Page 309

Oct 1/79

C. Inspect Bolt Locations.

(1) Wear and fretting.

- (a) Bolt holes elongated not more than 0.030 in. (0,760 mm); flange thickness not reduced more than 5 per cent. Accept.

(2) Nicks and burrs.

- (a) Small edge burrs. Accept after repair.

D. Carry Out Dimensional Checks.

- (1) Check labyrinth housing and rotor disk location diameters (F.C.S.601-213 and 215).

NOTE: Make these checks in conjunction with the Labyrinth Housing (para.5) and the Rotor Disk (para.13).

- (a) Within F.C.S. limits. Accept.

10. Hub Assembly (302-210)

CAUTION: HUB UNITS HAVE A CENTERING RING SHRUNK INTO BORE AT RETAINING NUT POSITION; BOTH ITEMS ARE BALANCED TOGETHER AS AN ASSEMBLY. IF CENTERING RING IS NOT IN POSITION, INSPECT HUB AS DETAILED SUBSEQUENTLY, BUT DO NOT RELEASE FOR USE UNTIL CENTERING RING HAS BEEN REFITTED OR REPLACED AND ASSEMBLY HAS BEEN RE-BALANCED AND SUBJECTED TO RE-INSPECTION.

A. Inspect Hirth Serrations.

(1) Fretting.

- (a) Identify original machining witness mark; measure crests and troughs of any fretting.
- (i) Not more than 0.001 in. (0,03 mm) above and below witness mark. Accept.

B. Inspect Bolt Location Bores.

CAUTION: THE BOLT HOLE BORES ARE A CRITICAL AREA. (Ref.Fig.309). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

NOTE: Examine the hub and check that a letter T is marked adjacent the Part No. If the letter T is not present, and the hub life is between 500 and 2250 cycles, the hub must be crack tested to the F3A process and examined for cracks at all areas adjacent the bolt-holes (Ref. S.B.72-8673-240).

(1) Cracks.

(a) Any cracks. Reject.

(2) Scores.

(a) Any scoring at bolt land locations. Reject.

C. Inspect No.27, 28 and 29 Labyrinth and No.30 Windback Seals.

(1) Overheating discolouration. Reject.

(2) Rubbing

(a) Slight rubbing within F.C.S. limits. Accept.

(3) Nicks and burrs. Accept after repair.

(4) Damage to fin edges.

Accept after repair, providing that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that blends on adjacent fins are separated radially by not less than five times fin depth at their ends, and the F.C.S. limits are not violated.

NOTE: Damage greater than this will required repair (Ref.72-52-02 Repair No.1).

D. Inspect Splines.

CAUTION: THE SPLINES ARE A CRITICAL AREA. (Ref.Fig.309). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

- (1) Nicks and burrs. Accept after repair.
- (2) Fretting on flanks.
 - (a) Not more than 0.001 in. (0,030 mm) above or below machining witness mark. Accept.

E. Inspect Location Bores for Drive Shaft and Centering Ring (see CAUTION).

- (1) Nicks and burrs. Accept, if repair does not violate F.C.S. limits.

F. Inspect Flange Fillet Radius.

CAUTION: THE FLANGE FILLET RADIUS IS A CRITICAL AREA.
(Ref. Fig.309). SPECIAL ATTENTION MUST BE
PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING
THE GENERAL OVERALL INSPECTION.

(1) Cracks. Reject.

G. Inspect Vent Holes.

CAUTION: THE VENT HOLES ARE A CRITICAL AREA.
(Ref. Fig.309). SPECIAL ATTENTION MUST BE
PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING
THE GENERAL OVERALL INSPECTION.

(1) Cracks. Reject.

H. Carry Out Dimensional Checks.

(1) Check cooling air duct location bore (F.C.S.601-215).

NOTE: Make this check in conjunction with the
cooling air duct (para.9).

(a) Within F.C.S. limits. Accept.

(2) Check drive shaft location bore (F.C.S.601-216).

NOTE: Make this check in conjunction with the
LP compressor drive shaft (Ref.72-31-04).

(a) Within F.C.S. limits. Accept.

(3) Check diameter of Nos.27, 28, 29 and 30 seals.
(F.C.S.602-227 and 217/218/219).

NOTE: Make this check in conjunction with the
LP turbine bearing support (Ref.72-52-03).

(a) Within F.C.S. limits. Accept.

- (4) Check square dimensions of splines (Ref.72-09-00 Inspection/Check) (F.C.S.601-220).

NOTE: Make this check in conjunction with the LP compressor drive shaft (Ref.72-31-04).

- (a) Identify master spline at adjusting washer location end.

NOTE: This item contains 59 splines, pitched as for 60 with one uncut at master spline.

- (b) Any side of square outside F.C.S. limits. Reject.

- (c) Within F.C.S. limits. Accept.

- (5) Check centering ring bore (F.C.S.602-224).

NOTE: See CAUTION. If centering ring not fitted, check location bore in hub (F.C.S.601-225).

NOTE: Make this check in conjunction with the LP compressor drive shaft (Ref.72-31-04). If ring not fitted, check also replacement centering ring diameter (F.C.S.601-225).

- (a) Within F.C.S. limits. Accept.

- (6) Check bearing inner track location diameter (F.C.S.601-221).

NOTE: Make this check in conjunction with the bearing inner race (para.8).

- (a) Within F.C.S. limits. Accept.

J. Inspect for Corrosion.

- (1) Carry out visual and binocular inspections. Identify any areas of corrosion pitting or areas of adherent oxide.

Submit details to Rolls-Royce plc for individual assessment

11. Centering Ring (302-220)

NOTE: This item is shrunk into centre bore of turbine hub (para.10). Observe CAUTION at head of para.10 if centering ring has been displaced or dislodged from hub, and inspect as detailed. If in position, follow para.10.F.(5).

A. Inspect Locating Faces and Bore.

(1) Nicks, burrs and scores.

Accept, if repair does not violate F.C.S. limits.

ATP TEMPORARY REVISION

British airways

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No.0-2

David Howard

For Chief Technical and Industrial Services Engineer CAA Design Approval No.DA1/8566/78

TEMPORARY REVISION NO.72-568

Insert in 72-52-02 after page 314

REASON FOR ISSUE

BEOL NOTE added

ACTION

Read the following BEOL NOTE after paragraph 12 existing 2nd NOTE

BEOL NOTE:

Where blades belonging to British Airways are divorced for any reason from the Ol1 Module in which they arrived at BEOL, they are to be life marked by vibro peening using the following coding table. The life in hours is to be obtained by reference to the module log card in conjunction (if applicable) to the previous L.P. turbine blade build life record sheet.

Individual reference to blades on the blade build sheet is possible due to the unique serial numbering of the blades. The marking is to be confined to the area on the front surface of the fir tree root extension but must not approach closer than 0.060" to the run out of the fillet radius on the end of the serrations.

A	0-100	J	801-900	R	1,601-1,700
B	101-200	K	901-1,000	S	1,701-1,800
C	201-300	L	1,001-1,100	T	1,801-1,900
D	301-400	M	1,101-1,200	U	1,901-2,000
E	401-500	N	1,201-1,300	V	2,001-2,100
F	501-600	O	1,301-1,400	W	2,101-2,200
G	601-700	P	1,401-1,500	X	2,201-2,300
H	701-800	Q	1,501-1,600	Y	2,301-2,400
				Z	2,401-2,500

Only one letter should be used to denote an achieved life; should the occasion arise where the life exceeds the range covered by the chart, the letter Z must be used in conjunction with one other letter to denote the life marking required.

B. Carry Out Dimensional Checks.

NOTE: Make this check in conjunction with the turbine hub (para.10) and LP compressor drive shaft (Ref.72-31-04).

12. LP Turbine Blades - 79 off (302-230)

NOTE: Before commencing this inspection, ensure that the turbine slackness check was carried out during disassembly (Ref.72-52-02 Disassembly).

NOTE: Engines may have blades to either bridge piece or pad standard.

A. Inspect Blades (Ref.Fig.304/305).

(1) Cracks.

(a) Other than in (b) and (c). Reject.

(b) Between cooling holes in bridge piece; in bridge piece braze on underside of shroud from notch radius, but not extending into long face. Accept.

(c) In short face of pad braze, on either surface, but not extending into long face. Accept.

(2) Distortion of outer shroud platform.

(a) Obvious distortion downstream of bridge piece on convex side of aerofoil. Reject.

(3) Distortion of bridge piece.

(a) Flatness on diagonal (short) from leading to trailing edge notch radius within 0.002 to 0.003 in. (0,050 to 0,076 mm) and not more than 0.010 in. (0,250 mm) on opposite (long) diagonal. Accept.

(4) Overheating.

- | | | |
|-----|--|---------|
| (a) | Obvious burning, erosion,
deposition of material. | Reject. |
|-----|--|---------|

(5) Impact damage (Ref.Fig.304/305).

NOTE: All acceptable damage must be smooth-contoured, crack-free, and not penetrating cooling passages.

- | | | |
|-----|---|----------------------------|
| (a) | Any damage outside
zones A, B and C. | Reject. |
| (b) | Any measurable damage
in zone A. | Reject. |
| (c) | Not more than 0.080 in.
(2,030 mm) in diameter
and not more than 0.010 in.
(0,250 mm) in depth in
zone B. | Accept, subject
to (d). |
| (d) | Not more than 0.125in.
(3,170 mm) in diameter
and not more than 0.015 in.
(0,380mm) in depth in
zone C. | Accept,
subject to (c). |

(6) Deformation of leading and trailing edges
(Ref.Fig.304/305).

NOTE: All acceptable damage must be smooth-contoured and crack-free.

- | | | |
|-----|--|----------------------------|
| (a) | Any deformation in zone A. | Reject. |
| (b) | Not more than 0.010 in.
(0,250 mm) in zone B. | Accept, subject
to (c). |
| (c) | Not more than 0.020 in.
(0,500 mm) in zone C. | Accept, subject
to (b). |

B. Check Cooling Air Passages.

- (1) Any obstruction.

Reject for re-
cleaning (Ref.
72-52-02 Cleaning).

C. Inspect Abutment Faces (Ref.Fig.304/305).

- (1) Scores, nicks and burrs.

Accept after
repair.

- (2) Fretting and wear.

- (a) Not more than 0.010 in.
(0,250 mm) on platforms.

Accept.

- (b) Light witness mark or
minimal pitting only
on bridge piece faces.

Accept.

D. Inspect Blade Roots.

- (1) Wear and fretting of serrations.

- (a) Light, even witness mark
on flanks, with no
stepping.

Accept.

E. Inspect Platform Seal Fins.

- (1) Nicks and burrs.

Accept after
repair.

F. Inspect Root Extension Front Face
and Root Heel.

- (1) Rubbing.

- (a) Axial rub marks not more
than 0.015in. (0,380 mm).

Accept.

- (b) Light rub marks only on
root heel.

Accept.

13 Turbine Rotor Disk (302-250)

A. Inspect Hirth Serration Flanks.

(1) Fretting.

- (a) Identify original machining witness mark; measure crests and troughs of any fretting.

- (i) Not more than 0.001 in. (0,030 mm) above and below witness mark. Accept.

B. Inspect Bolt Location Bores.

CAUTION: THE BOLT HOLE BORES ARE A CRITICAL AREA. (Ref.Fig.310). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

(1) Scores.

- (a) Any scoring at bolt land locations. Reject.

C. Inspect Blade Root Locations.

CAUTION: THE RIM SLOTS ARE A CRITICAL AREA. (Ref.Fig.310). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

(1) Fretting and wear.

- (a) Light, even witness mark on flanks, with no stepping. Accept.
- (b) Light rub mark only on rear face between root locations. Accept.

(2) Rubbing.

- (a) Not more than 0.005 in. (0,130 mm) between locations on rear face. Accept.

INSPECTION/CHECK

D. Inspect No.26 Labyrinth Housing Abutment Faces and Location Diameter.

(1) Scoring.

(a) Not more than 0.005 in. (0,130 mm) deep.	Accept, if repair preserves F.C.S. limits.
---	--

(2) Nicks and burrs.	Accept, if repair preserves F.C.S. limits.
----------------------	--

E. Inspect Boss Fillet Radius.

CAUTION: THE BOSS FILLET RADIUS IS A CRITICAL AREA.
(Ref. Fig.310). SPECIAL ATTENTION MUST
BE PAID TO THIS AREA FOR SIGNS OF DAMAGE
DURING THE GENERAL OVERALL INSPECTION.

(1) Cracks.	Reject.
-------------	---------

F. Carry Out Dimensional Checks.

(1) Check labyrinth housing location diameter (F.C.S 601-214).

NOTE: Make this check in conjunction with No.26
labyrinth housing (para.5).

(a) Within F.C.S. limits.	Accept.
---------------------------	---------

(2) Check disk bore dimensions (Ref.Fig.307).

(a) Measure and record
diameters A, B and C
at eight positions.

(b) Note and record etched
bore dimension on rear
face of blade retaining
lug.

NOTE: Nominal bore is 5.100-55.110 in.
(129, 540-129, 794 mm).

(i) Any variation of more than 0.001 in. (0,030 mm) from etched dimension.	Reject for investigation.

OVERHAUL

sneema

- (ii) Dimension within 0.001 in. (0,030 mm) of etched dimension. Accept.

(3) Check disk diameter (Ref.Fig.308).

NOTE: The turbine disk true diameter cannot be measured directly due to the odd number of blade root slots.

NOTE: Refer to documentation and or inspection sheets to determine positions at which previous dimension checks were carried out, and ensure that the same positions are used for the current dimension check.

- (a) Measure the diameter at eight positions, ensuring that the measurements are carried out at the positions detailed in Fig.308. Record the position (if not recorded previously) on the appropriate documentation and/or inspection sheets.
- (b) Compare the dimensions with the previously recorded dimensions obtained at the same positions detailed in Fig.308, or if not available, with the etched dimension on the rear face of the blade retaining lug.

- (i) Any variations of more than 0.003 in. (0,080 mm) from previously recorded dimension obtained at the positions detailed in Fig.308. Reject for investigation.
- (ii) Any variations of more than -0.005 in. (0,130 mm) or +0.001 in. (0,030 mm) from etched dimension on disk. Reject for investigation.

OVERHAUL

sneema

(iii) Dimensions within limits of (i) or (ii). Accept.

(4) Check axial set of disk (Ref.Fig.307).

(a) Measure and record dimension E at eight positions. Datum is front face of labyrinth housing support ring on disk front face. Measured distance is from datum to front face of disk edge between root locations.

(i) Dimensions outside limits in (ii). Reject for investigation.

(ii) Dimension within 0.449-0.454 in. (11,400-11,530 mm). Accept.

G. Hardness Check.

(1) In the event that the turbine items have been returned for inspection due to overheating (or suspected overheating), carry out a hardness test on the turbine disk as follows.

(a) Smooth the disk with an abrasive, at four equally spaced positions on each face of the disk around the rims, centrally on the metal between the blade root locations (Ref.Fig.307).

(b) Test the hardness of the disk at the smoothed areas of the disk using a 5 kg load. The disk is acceptable providing the hardness value is above 350 HV, the variation between the maximum and minimum values is less than 20 HV, and there is no consistent difference in the value of hardness between the front and rear faces.

(2) All results whether or not they meet the acceptable hardness values, should be forwarded together with the disk serial No. to Rolls-Royce plc, Bristol.

LP TURBINE BEARING SUPPORT - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

OVERHAUL

B. Inspect Bolt Locations.

(1) Wear and fretting.

- | | |
|--|---------|
| (a) Any elongation of bolt-holes. | Reject. |
| (b) Flange thickness not reduced more than 5 per cent. | Accept. |

C. Inspect Headless Pin Location.

NOTE: Make this check in conjunction with the Headless Shoulder Pin (para.9).

(1) Damage.

- | | |
|--|----------------------|
| (a) Any damage other than slight edge burrs. | Reject. |
| (b) Slight edge burrs only. | Accept after repair. |

(2) Compatibility.

- | | |
|--------------------------------|---------|
| (a) Cover compatible with pin. | Accept. |
|--------------------------------|---------|

D. SB.72-180 standard cover (1-70B)

- | | |
|---|----------------------|
| (1) Inspect security of the two peened bolts. | Accept after repair. |
|---|----------------------|

6. Transfer Block (302-80)

A. Inspect Abutment Faces.

- | | |
|--|--|
| (1) Nicks and burrs; scoring not more than 0.005 in. (0,130 mm) deep and not more than half-way across sealing face. | Accept after repair providing sealing capability is preserved. |
|--|--|

B. Inspect Oil Tube Location Bore.

- | | |
|---|--|
| (1) Nicks and burrs; scoring not more than 0.005 in. (0,130 mm) deep. | Accept after repair providing sealing capability is preserved. |
| (2) Compatibility (Ref.para.8.B(2)). | |
| (a) Oil tube a tight firm fit in transfer block bore. | Accept. |

7. Oil Tube (302-110)

A. Inspect Tube (Ref.72-09-00 Inspection/Check).

B. Inspect Attachment Flange.

- (1) Nicks and burrs; scoring not more than 0.005 in. (0,130 mm) deep and not more than half-way across sealing face.

Accept after repair providing sealing capability is preserved.

C. Inspect Bolt Locations.

- (1) Wear and fretting.

- (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm); flange thickness not reduced more than 10 per cent.

Accept.

8. Oil Tube (302-120) (Ref.SB.72-40 Part 2)

A. Inspect Tube (Ref.72-09-00 Inspection/Check).

B. Inspect Silver Plated Ends.

- (1) Damage.

- (a) Any exposure of parent metal.

Reject for re-plating (Ref.72-09-00 Repair).

- (2) Compatibility.

NOTE: For compatibility checks the oil tube must enter the oil transfer block without undue resistance. With the tube located in the transfer block there must be no detectable lateral movement between the tube and transfer block.

- (a) Oil tube a tight firm fit in transfer block bore (302-80, para.6).

Accept.

C. Inspect Attachment Flange.

- (1) Nicks and burrs.

Accept after repair.

(2) Wear and fretting.

- (a) Bolt-hole elongated
not more than 0.030 in.
(0,760 mm); flange
thickness not reduced
more than 10 per cent.

Accept.

9. Headless Shoulder Pin (302-150)

A. Inspect Pin.

NOTE: Make this check in conjunction with the Cover
(para.5) and Rear Cover (para.10).

- (1) Damage.
(2) Compatibility.

Reject.

- (a) Pin compatible with
both covers.

Accept.

10. Rear Cover (302-160)

A. Inspect Self-locking Shank Nuts 302-190 (Ref.72-09-00
Inspection/Check).

B. Inspect Front and Rear Abutment Flanges.

- (1) Nicks and burrs; scoring
not more than 0.005 in.
(0,130 mm) deep and not
extending right across
sealing face.

Accept after repair
providing sealing
capability is
preserved.

C. Inspect Internal Flange.

- (1) Nicks, burrs and scores.
(a) On general area.
(b) At bolt locations,
slight scores only.

Accept after
repair.

Accept after
repair.

(2) Dents.

- (a) Smooth-contoured, free of punctures or impact marks.

Accept after repair.

D. Inspect Union Nut 302-200 and Ferrule 302-210 (Ref.72-09-00 Inspection/Check).

E. Inspect Casing Body.

- (1) Nicks, burrs and scores.

Accept after repair.

(2) Dents.

- (a) Smooth-contoured, free of punctures or impact marks.

Accept after repair.

F. Inspect Chopper Mechanism Bush and Sealing Ring Groove.

- (1) Nicks and burrs.

Accept, if repair preserves seal groove profile.

(2) Scores.

- (a) Not more than 0.005 in. (0,130 mm) deep.

Accept after repair providing seal ring groove sealing capability is preserved.

G. Inspect Chopper Mechanism Mounting.

- (1) Nicks, burrs and scores.

Accept after repair.

(2) Wear and fretting.

- (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm); flange thickness not reduced more than 5 per cent.

Accept.

H. Inspect Bolt Locations.

(1) Wear and fretting.

- | | | |
|-----|--|---------|
| (a) | Bolt-holes elongated
not more than 0.030 in.
(0,760 mm); flange
thickness not reduced
more than 10 per cent. | Accept. |
|-----|--|---------|

J. Inspect Headless Pin Locations.

NOTE: Make these checks in conjunction with the
Headless Shoulder Pins (para.9).

(1) Damage.

- | | | |
|-----|---|-------------------------|
| (a) | Any damage other than
slight edge burrs. | Reject. |
| (b) | Slight edge burrs only. | Accept after
repair. |

(2) Compatibility.

- | | | |
|-----|-------------------------------------|---------|
| (a) | Cover compatible
with both pins. | Accept. |
|-----|-------------------------------------|---------|

K. Carry Out Dimensional Checks.

- (1) Check cover assembly locating diameter (F.C.S.
601-260).

NOTE: Make this check in conjunction with the
Cover Assembly (para.14).

- | | | |
|-----|-----------------------|---------|
| (a) | Within F.C.S. limits. | Accept. |
|-----|-----------------------|---------|

11. Air Feed Socket (303-20) and Vent Sockets - 2 off (303-40)

A. Inspect Locating Surfaces.

- | | | |
|-----|---|---|
| (1) | Nicks and burrs. | Accept after
repair. |
| (2) | Fretting. | |
| (a) | Not more than 0.001 in.
(0,030 mm) deep. | Accept after repair
providing F.C.S.
limits not violated. |

B. Inspect Bolt Locations.

(1) Wear and fretting.

- (a) Bolt-holes elongated
not more than 0.030 in.
(0,760 mm); flange
thickness not reduced
more than 10 per cent.

Accept.

C. Carry Out Dimensional Check.

- (1) Check seal ring "gap in position" (F.C.S.602-254) at
normal location.

NOTE: Use new seal ring for this check (Ref.72-53-00
Turbine Exhaust Diffuser).

- (a) Gap within F.C.S. limits.

Accept.

12. Cover - 2 off (303-90)

A. Inspect Abutment Face.

- (1) Nicks, burrs and scores.

Accept after
repair.

B. Inspect Bolt Locations.

(1) Wear and fretting.

- (a) Bolt-holes not elongated
more than 0.030 in.
(0,760 mm); flange
thickness not reduced
more than 10 per cent.

Accept.

13. Seal Housings - 2 off (303-100)

A. Inspect Bore.

- (1) Nicks and burrs.

Accept, if repair
does not violate
F.C.S. limits.

(2) Fretting.

- (a) Not more than 0.001 in.
(0,030 mm) deep.

Accept, providing
F.C.S. limit is
not violated.

B. Inspect Abutment Face.

- (1) Nicks, burrs and scores.

Accept after
repair.

C. Inspect Bolt Locations.

- (1) Wear and fretting.

- (a) Bolt-holes elongated
not more than 0.030 in.
(0,760 mm); flange
thickness not reduced
more than 10 per cent.

Accept.

D. Carry Out Dimensional Checks.

- (1) Check seal gap in bore location, using new seal
(F.C.S.602-248 and 252).

NOTE: Make this check in conjunction with the Seal
Rings, Ref.72-53-00 (302-410, 303-20).

- (a) Within F.C.S. limits.

Accept.

14. Cover Assembly (303-110)

A. Inspect Self-locking Shank Nuts (Ref.72-09-00 Inspection/
Check).

B. Inspect Front and Rear Locating Bore Faces.

- (1) Nicks, burrs and scores.

Accept, providing
repair does not
violate F.C.S.
limits.

- (2) Fretting.

- (a) Not more than 0.002 in.
(0,050 mm) deep.

Accept, providing
repair does not
violate F.C.S.
limits.

C. Inspect Seal Housing and Socket Locating Bores.

- (1) Nicks, burrs and scores. Accept after repair.
- (2) Fretting.
 - (a) Not more than 0.003 in. (0,080 mm) deep. Accept after repair.

D. Inspect Bolt Locations.

- (1) Wear and fretting.
 - (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm); flange thickness not reduced more than 10 per cent. Accept.

E. Inspect Cover Skin.

- (1) Dents.
 - (a) Smooth-contoured, free of punctures or impact marks. Accept, if repairable without cracking.

F. Carry Out Dimensional Checks.

- (1) Check bearing housing and rear cover assembly locating bores (F.C.S.601-257 and 260).

NOTE: Make this check in conjunction with the Bearing Housing (para.18) and the Rear Cover (para.10).

- (a) Within F.C.S. limits. Accept.

15. Sleeve Assembly (303-130)

A. Inspect Front and Rear Locating Bore Faces.

- (1) Nicks, burrs and scores. Accept, providing repair does not violate F.C.S. limits.

(2) Fretting.

- (a) Not more than 0.002 in.
(0,020 mm) deep.

Accept, providing
repair does not
violate F.C.S.
limits.

B. Inspect Seal Housing and Socket Location Bores.

- (1) Nicks, burrs and scores.

Accept after
repair.

(2) Fretting.

- (a) Not more than 0.003 in.
(0,080 mm) deep.

Accept after
repair.

C. Inspect Sleeve Skin.

- (1) Dents.

- (a) Smooth-contoured, free
of punctures or impact
marks.

Accept if repair-
able without
cracking.

D. Carry Out Dimensional Checks.

- (1) Check bearing housing locating bores (F.C.S.601-258
and 259).

NOTE: Make this check in conjunction with the
Bearing Housing (para.18).

- (a) Within F.C.S. limits.

Accept.

16. LP Turbine Bearing Outer Race and Rollers (303-140)

A. Inspect Bearing (Ref.72-09-00 Inspection/Check).

B. Inspect Locating Dogs.

- (1) Nicks and burrs.

Accept after
repair.

(2) Wear.

- (a) Not more than 0.001 in.
(0,030 mm) on flanks.

Accept.

(3) Distortion.

Reject.

C. Carry Out Dimensional Checks.

(1) Check track outer diameter (F.C.S.601-223).

NOTE: Make this check in conjunction with the Bearing Housing (para.18).

(a) Within F.C.S. limits. Accept.

(2) Check diametric clearance (F.C.S.601-222).

NOTE: Make this check in conjunction with the LP Turbine Bearing Inner Track (Ref.72-52-01).

(a) Within F.C.S. limits. Accept.

17. Outer Labyrinth Housing (303-180)

A. Inspect Nos.27 and 28 Labyrinth Seal Housing Bores.

(1) Nicks and burrs.

Accept after repair.

(2) Grooving.

(a) Any damage greater than (b).

Accept after repair (Ref.72-52-03 Repair No.1).

(b) Any number of grooves, provided that they are all contained within an arc not greater than 60 degrees of bore mean circumference, that maximum depth is not greater than 0.005 in. (0,130 mm) and that F.C.S. limits are not violated.

Accept.

(3) Distortion.

(a) Provided that minimum local clearance is not more than 0.006 in. (0,150 mm) below the minimum permissible dimension in the F.C.S.

Accept.

B. Inspect Abutment Face and Bearing Housing Location Diameter.

(1) Nicks, burrs and scores.

(a) On abutment face.

Accept after repair.

(b) On location diameter.

Accept, if repair does not violate F.C.S. limits.

(2) Fretting.

(a) Not more than 0.002 in.
(0,050 mm) deep on location diameter.

Accept, if repair does not violate F.C.S. limits.

C. Inspect Bolt Locations.

(1) Wear and fretting.

(a) Bolt-holes elongated not more than 0.010 in.
(0,250 mm); flange thickness not reduced more than 5 per cent.

Accept.

D. Carry Out Dimensional Checks.

(1) Check bearing housing locating diameter (F.C.S. 601-226).

NOTE: Make this check in conjunction with the Bearing Housing (para.18).

(a) Within F.C.S. limits.

Accept.

(2) Check bores of Nos.27 and 28 labyrinth seal housings (F.C.S.601-227 and 217).

NOTE: Make this check in conjunction with the LP Turbine Rotor Hub (Ref.72-52-02).

(a) Within F.C.S. limits.

Accept.

(b) On location faces.

Accept, if repair
does not violate
F.C.S. limits.

(2) Fretting.

(a) Not more than 0.005 in.
(0,130 mm) deep on
location faces.

Accept, if repair
does not violate
F.C.S. limits.

F. Inspect Bolt Locations.

(1) Wear and fretting.

(a) Bolt-holes elongated
not more than 0.010 in.
(0,250 mm); flange
thickness not reduced
by more than 5 per cent.

Accept after
repair.

G. Inspect Tube Attachment Threads (Ref.72-09-00 Inspection/
Check).

H. Inspect the Seatings.

(1) Nicks and burrs.

Accept, if repair
preserves sealing
capability.

(2) Scores.

(a) Not more than 0.002 in.
(0,050 mm) deep.

Accept, if repair
preserves sealing
capability.

J. Inspect Oilways (Ref.SB.72-40).

(1) Obstruction.

(a) Any obstruction.

Reject for re-
cleaning (Ref.
72-52-03 Cleaning).

(2) Fretting.

(a) Fretting at signal oil
supply tube (302-120)
location bore, not more
than 0.001 in.
(0,030 mm) deep.

Accept, if repair
preserves sealing
capability.

TURBINE EXHAUST DIFFUSER - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

(4) Scoring.

- (a) Not more than 0.010 in.
(0,250 mm) in depth.

Accept after repair
providing material
thickness is not
reduced by more
than 10 per cent.

5. Elbows (302-50/220 and 303-120)

A. Inspect Tube Seal Location.

- (1) Fretting.

Accept after
repair providing
sealing
capabilities are
unimpaired.

- (2) Nicks and burrs.

- (a) Small dressable amounts.

Accept after
repair if surface
flatness preserved.

B. Inspect Face of Case Abutment Flange.

- (1) Fretting.

- (a) Not more than 0.005 in.
(0,130 mm) deep.

Accept after
repair if surface
flatness preserved.

- (2) Nicks and burrs.

- (a) Small dressable amounts.

Accept after
repair.

C. Inspect Ducting (Ref.72-09-00 Inspection/Check Rigid Tubes).

D. Distortion.

Accept if
compatibility is
preserved.

6. Air Duct Assemblies (302-60/230 and 303-130) (Ref. S.B.72-129
and 72-130)

A. Inspect Face of Case Abutment Flange.

- (1) Distortion.

Accept if
compatibility is
preserved.

- (2) Scores.
- (a) Not more than 0.005 in.
(0,130 mm) in depth. Accept after repair providing score does not extend right across sealing face.
- (3) Nicks and burrs.
- (a) Small dressable amounts. Accept after repair if surface flatness preserved and sealing capabilities are unimpaired.
- B. Inspect Seal Housing Location.
- (1) Distortion. Accept if compatibility is preserved.
- (2) Scores.
- (a) Not more than 0.005 in.
(0,130 mm) deep. Accept after repair providing score does not extend right across sealing face and surface flatness preserved.
- C. Inspect Thread Inserts (Pre S.B.72-130) (Ref.72-09-00 Inspection/Check).
- D. Inspect Ducting (Ref.72-09-00 Inspection/Check Rigid Tubes).
- (1) Distortion. Accept if duct bore dimensions have not been reduced.
- (2) Fretting.
- (a) Not more than 0.007 in.
(0,180 mm) deep. Accept after repair. If fretting exceeds the limit refer to SB.72-8018-129.
7. Seal Housings (302-90/260 and 303-160)
- A. Inspect Seal Location Bore (F.C.S.601-254).
- (1) Fretting.
- (a) Not more than 0.001 in.
(0,030 mm) deep. Accept, if within F.C.S. limits after repair.

OLYMPUS 593

MK.610-14-28

OVERHAUL

(2) Nicks, scores and burrs.

Reject.

(3) Wear.

(a) Within F.C.S. limits.

Accept.

B. Inspect Duct Abutment Flange.

(1) Scores.

(a) Not more than 0.005 in.
(0,130 mm) deep.

Accept if score
does not extend
right across
sealing face.

(2) Nicks and burrs.

(a) Small dressable areas.

Accept after
repair.

C. Inspect Thread Inserts (Ref.72-09-00 Inspection/Check).

8. Locking Plates (302-120/290 and 303-190)

A. Inspect Locking Plates.

(1) Distortion.

Accept if
compatibility is
preserved.

(2) Wear and fretting.

(a) Attachment face thickness
reduced by not more than 10
per cent.

Accept after
repair.

(b) Bolt-holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

(3) Nicks and burrs.

Accept after repair.

9. Seal Carriers (302-140/310 and 303-210)

A. Inspect Seal Carrier (F.C.S.601-254).

(1) Wear.

(a) Within F.C.S. limits.

Accept.

(2) Fretting.

- (a) Not more than 0.001 in.
(0,030 mm) deep.

Accept, if within
F.C.S. limits after
repair.

(3) Nicks and burrs.

Accept, if within
F.C.S. limits after
repair.

10. Seal Housing Assemblies (302-340 and 303-40)

A. Inspect Seal Location Bores.

(1) Wear.

- (a) Not more than 0.010 in.
(0,250 mm) deep.

Accept.

(2) Fretting.

- (a) Not more than 0.010 in.
(0,250 mm) deep.

Accept after
repair.

(3) Nicks and burrs.

Accept after
repair.

B. Inspect Casing Abutment Flange.

(1) Distortion.

Accept if
compatibility is
preserved.

(2) Wear and fretting.

- (a) Attachment face thickness
reduced by not more than
10 per cent.

Accept after
repair.

- (b) Bolt-holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

(3) Scoring.

- (a) Not more than 0.005 in.
(0,130 mm) deep.

Accept if score
does not extend
right across the
sealing face.

(4) Nicks and burrs.

Accept after
repair.

11. Tubes, Oil Scavenge and Feed (302-330 and 303-30)

A. Inspecting Insulating Blanket. (Not applicable to
SB.72-102 standard).

- (1) Torn, fractured, defective spot-welding. Reject.
- (2) Minor dents with smooth contour. Accept.
- (3) Powdering and collapse of filler. Reject.

NOTE: Press blanket with finger tips and note any
lack of 'cushion' effect to detect powdering.

B. Inspect Tubes (Ref.72-09-00 Inspection/Check).

NOTE: On units incorporating SB.72-48, check that the
jet guard (303-25) has been removed for inspection
(Ref. Para.30).

C. Inspect Seal Housing Location.

- (1) Wear.
- (a) Not more than 0.020 in.
(0,500 mm) deep. Accept.
- (2) Nicks and burrs. Accept after
repair.
- (3) Fretting.
- (a) Not more than 0.020 in.
(0,500 mm) deep. Accept after
repair.

(4) Clearance in housing (Ref.F.C.S.601-249/253).

D. Inspect Sealing Nipple and Seating.

(1) Nicks and burrs.

Accept, if sealing
capability unim-
paired after repair.

(2) Fretting.

(a) Not more than 0.001 in.
(0,030 mm) deep.

Accept, if sealing
capability unim-
paired after repair.

E. Inspect Bearing Housing Seal Groove (Ref.Fits and Clearances F.C.S.601-251).

NOTE: Carry out this check in conjunction with the Seal Ring Assembly (303-20 para.12).

(1) Within F.C.S. limits.

Accept.

12. Seal Ring Assembly (302-410 and 303-20)

A. Carry Out Dimensional Checks (Ref.72-53-00 Fits and Clearances F.C.S.601-247/248/251/252).

NOTE: Carry out these checks in conjunction with the Seal Housing (Ref.72-52-03/303-100), the Oil Feed Tube (303-30) and the Cold Air Vent Tube (302-420).

(1) Within F.C.S. limits.

Accept.

13. Tube, Cold Air Vent (302-420)

A. Inspect Tube (Ref.72-09-00 Inspection/Check).

NOTE: When inspecting these tubes, large areas of moderate fretting in the form of numerous small smooth-edged pits may be accepted, without complete blending, provided that the minimum wall thickness is not less than 0.035 in. (0,890 mm).

B. Inspect Spherical Elbow Location (F.C.S.601-250).

NOTE: Carry out the following dimensional check in conjunction with the mating tube assembly (Ref. 75-02-03 Inspection/Check - 302-240).

(1) Wear.

(a) Within F.C.S. limits.

Accept.

NOTE: Carry out this check in conjunction with the Seal Ring Assembly (302-410 para.12).

(1) Within F.C.S. limits

Accept.

14. Retaining Plates - 4 Off (304-10)

A. Inspect Plates.

(1) Distortion.

Accept if
compatibility is
preserved.

(2) Wear and fretting.

(a) Attachment face thickness
reduced by not more than
10 per cent.

Reject.

(b) Bolt-holes elongated not
more than 0.030 in.
(0,720 mm).

Accept after
repair.

(3) Nicks and burrs.

Accept, if attach-
ment face thickness
preserved after
repair.

15. Headless Pins - 4 Off (304-20)

A. Inspect Pins.

(1) Distortion.

Reject.

(2) Fretting.

(a) Not more than 0.002 in.
(0,050 mm) deep.

Accept after
repair.

(3) Nicks, burrs and scores.

(a) Extensive.

Reject.

(b) Small dressable amounts.

Accept after
repair.

16. Containment Shield (304-30)

A. Inspect Shield.

(1) Scores.

(a) Not more than 0.005 in.
(0,130 mm) deep.

Accept after
repair.

B. Inspect Mounting Bracket Locations.

(1) Wear and fretting.

Accept, if surface
flatness retained
after repair.

(2) Nicks and burrs.

Accept, if surface
flatness retained
after repair.

C. Inspect Thread Inserts (Ref.72-09-00 Inspection/Check).

17. Blanking Covers - 5 Off (305-70), External Bosses - 5 Off (305-120) and Internal Plates - 5 Off (305-140)

A. Inspect Covers, Bosses and Plates (Pre SB.72-31).

(1) Distortion.

Accept if
compatibility is
preserved.

(2) Scores.

(a) Not more than 0.005 in.
(0,130 mm) deep.

Accept after
repair.

(3) Nicks and burrs.

Accept after
repair.

18. Gaskets - 4 Off (305-130) (Pre SB.72-31) Not illustrated

A. Inspect Silver Plating.

(1) Flaking, scores, erosion.

Reject.

A. Inspect Pin.

(1) Any damage.

Reject.

20. Retaining Bolts (305-160) 20 off

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

21. Hollow-headed Pins - 10 Off (305-180)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Pin Surfaces.

(1) Scores.

(a) Not more than 0.005 in.
(0,130 mm) deep.

Accept after
repair.

(2) Fretting.

(a) Not more than 0.002 in.
(0,050 mm) on diameter.

Accept.

22. Trunnion Nuts - 20 Off (305-190)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Surface.

(1) Nicks and burrs.

Accept after
repair.

23. Turbine Exhaust Diffuser Outer Case (305-230)

A. Inspect Flange Abutment and Attachment Faces.

(1) Scores.

(a) Not more than 0.005 in.
(0,130 mm) or more.

Accept, if score
does not extend
right across mating
face.

(2) Nicks and burrs.

Accept, if repair
preserves surface
flatness.

compatibility is
preserved.

B. Inspect Bolt Locations.

(1) Nicks and burrs.

Accept after repair.

(2) Fretting and wear.

(a) Any bolt-holes elongated.

Reject.

(b) Bolthead locations worn.

Accept, if location
function retained.

C. Inspect All External Abutment Faces.

(1) Scores.

(a) Not more than 0.005 in.
(0,130 mm) deep.

Accept, if score
does not extend
across sealing face.

(2) Nicks and burrs.

Accept, if repair
preserves surface
flatness.

D. Inspect Inner Diffuser Case Locating Faces.

(1) Nicks and burrs.

Accept after repair.

E. Inspect Hollow-headed Pin and Locking Plate Locations.

(1) Nicks and burrs.

Accept after repair.

F. Inspect Outer Surface.

(1) Nicks and burrs.

Accept after repair.

G. Inspect Shouldered Pin Locations.

NOTE: The shouldered pins will normally be assembled, one pin (Ref.305-150) in the rear flange at the top position, and two pins (Ref.76-21-02/1-110) at No.6 vane position on the outside of the case. If the pins are assembled, secure and serviceable, do not remove. If one or more of the pins are damaged, remove and reject the damaged pin(s).

(1) Scuffs, gouges and out of round.

Accept after repair
(Ref.72-53-00,

308-180/310 and 309-30/140/200)

A. Inspect Captive Nuts and Retainers (Ref.72-09-00 Inspection/
Check).

B. Inspect Brackets.

(1) Distortion and dents.

Accept, if com-
patibility is
preserved.

(2) Nicks and burrs.

Accept after repair.

(3) Wear or fretting.

(a) Attachment face thickness
reduced not more than
10 per cent.

Accept after repair.

(b) Bolt-holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

25. Rear Lifting Bracket (306-90)

A. Inspect Bracket.

(1) Distortion.

Reject.

(2) Wear and fretting.

(a) Bolt-holes elongated.

Reject.

(b) Pin location wear not
exceeding 0.001 in.
(0,030 mm).

Accept.

26. Mounting Brackets (306-130/320, 307-90/290, 308-120/350
and 309-70/240)

A. Inspect Brackets.

OVERHAUL

28. Mounting Plates (307-260/440 and 308-80)

A. Inspect Plates.

- | | |
|--|----------------------|
| (1) Distortion. | Reject. |
| (2) Fretting and wear. | |
| (a) Attachment face thickness reduced not more than 10 per cent. | Accept after repair. |
| (b) Bolt-holes elongated not more than 0.030 in. (0,760 mm). | Accept after repair. |

B. Inspect Attachment Faces and Spigot Bore.

- | | |
|-------------------------|---|
| (1) Nicks and burrs. | |
| (a) At attachment face. | Accept, if repair preserves surface flatness. |
| (b) At spigot bore. | Accept, if repair preserves concentricity. |

29. Turbine Exhaust Diffuser Inner Assembly (310-40)

A. Inspect Front and Rear Abutment Flanges.

- | | |
|--|---|
| (1) Fretting. | |
| (a) Not more than 0.002 in. (0,050 mm) deep. | Accept. |
| (2) Nicks and burrs. | Accept, if repair preserves surface flatness. |

B. Inspect Bolt Locations (Front Flange).

- | | |
|----------------------|----------------------|
| (1) Nicks and burrs. | Accept after repair. |
|----------------------|----------------------|

OVERHAUL

(2) Fretting and wear.

- (a) Any bolt-holes elongated. Reject.
- (b) Bolthead locations worn. Accept, if location function retained.

C. Inspect Threaded Components and Retainers (Ref.72-09-00 Inspection/Check).

NOTE: Items 310-10/20/30 are not used on assemblies with SB.72-31 incorporated.

NOTE: Assemblies with SB.72-31 incorporated have captive bolts with anchor plates (310-80/90) at the rear flange; unmodified engines have nuts and retainers (310-60/70).

D. Inspect Vane Surfaces and Abutment Faces.

(1) Dents (Ref.72-09-00 Inspection/Check Rigid Tubes).

- (a) Large, irregular dents; dents with impact marks. Reject.
- (b) Small dents with smooth contours not more than 2 per cent of 'normal' section thickness. Accept, if oil/air tubes not fouling.

(2) Nicks and burrs. Accept after repair.

(3) Fretting of inner surfaces (vaness carrying oil and air tubes).

- (a) Less than 10 per cent of sheet thickness. Accept.

(4) Metallic splatter.

- (a) Less than 0.010 in. (0,250 mm) in depth. Accept providing surface is no rougher than the unsplattered parent surface.

INSPECTION/CHECK

OVERHAUL

SNECMA

INSPECTION**1. Introduction****A. Inspection - General**

- (1) The estimate inspection, prepared during overhaul on the modules or separate disassembled components, has the object of :
- eliminating worn or deteriorated components which are impossible or too costly to be repaired. However, these components can be kept because certain sound portions of them may be usable for the repair of an identical component.
 - Indicating the modifications to be applied to bring up to a new standard.
 - Indicating the repairs to be carried out. If this repair has not been envisaged, make a request to the SNECMA repair design office.
 - Eliminating components that have reached their life limitation.

B. Preparation to the "Estimate" Inspection

- (1) Following disassembly, suitable cleaning for each component is given in the "cleaning" of the Overhaul Manual.

NOTE: Take care that any assembly "awaiting inspection" be stored in the "bins" or containers provided for this purpose.

This inspection must be carried out on thoroughly clean parts.

Place all the parts, making up the sub-assemblies, on the inspection tables covered with anti-shock material (Lino or similar material).

- (2) Make a list of the modifications to be applied for each sub-assembly.
- (3) Inspect the parts.

C. Estimate Inspection

CAUTION: THE COMPONENTS MUST BE HANDLED WITH THE GREATEST CARE DURING THE INSPECTION OPERATIONS SO AS TO AVOID SHOCKS, SCRATCHES, ETC.

INSPECTION/CHECK

72-54-01Page 301
Dec 1/97

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (1) Personnel in charge of this inspection must have a thorough knowledge of the instructions given in the Inspection and Repair sections of this manual and in the corresponding chapter 70.

They must be conscious of the importance of their decisions and of their consequences. A good technical and functional knowledge of the accessory will enable this personnel to carry out an efficient and intelligent inspection, particularly in vital zones.

- (2) The inspection methods to be used are as follows :

- visual inspection
- inspection for soundness
- dimensional inspection

NOTE - It is recommended that these inspection methods be followed as per the indicated order so that faulty, not repairable components detected during visual or soundness inspections can be rejected prior to dimensional inspection.

If new defects appear, the repairer must request SNECMA to design a repair scheme.

- (3) During the inspection, each component must be labelled (see chapter 70-10-00) so as to indicate :

- if it is suitable to be put back into service
- if a repair is necessary
- if it must be renewed

Labelling of components may also be used to note the value of certain dimensions measured which can affect a clearance or a tolerance. This makes it possible for the Inspection Dpt. to check the clearance or tolerance during final assembly.

D. Protection against corrosion after inspection

- (1) After inspection, when a fairly long time elapses before rebuild, carry out a temporary protection on steel components by using a dessicant oil such as Ensis Fluid 254 (P 309). Renew the protection every 4 days.

2. Visual inspection

- A. Visual inspection is an operation which starts on reception of the accessory (inventory), continues during disassembly on table inspection, re-assembly, testing and dispatching.

OVERHAUL**SEE TR**

- (1) Visual inspection generally concerns the following points :
- each part is inspected to ascertain its general condition and make sure that it is fit for service. Refer to chapter 70-21-00.
 - components made up of sheet metal elements must not feature sharp wounds, sheet metal burns, great distortions or burns.
 - threads and tapped holes must not be deteriorated.
 - hinge parts (such as pins/bores of bushes ; ball joint inner ring/outer ring of rods...) must not show seizing marks or scratches, otherwise remove them by emery cloth.
 - flaking of metallised zones of components is not acceptable.
 - rivets used to attach the various components on riveted assemblies must not be shaken loose, rotating or missing, otherwise change them.
 - self-locking nuts must have a satisfactory locking torque. See chapter 70-21-00 otherwise change them.
 - crimped self-locking nuts must be satisfactorily crimped. See chapter 70-21-00, otherwise change them.
- (2) Measures to be taken in relation to the faults found on parts are given in paragraph 5 "Parts Inspection".

3. Inspection for soundness

- A. The object of the inspection for soundness is to ensure that the module components are not cracked.

The inspection methods used are as follows :

- Visual inspection
- Inspection using dye penetrant see chapter 70-20-10.

M502 B - Inspection by fluorescent penetrant washable by water (except titanium parts) P by spraying T by dipping.

- B. The tabulation below gives the appropriate method for each component.

PARTS TO BE INSPECTED		INSPECTION METHOD	REMARKS AND ZONES REQUIRING CAREFUL EXAMINATION

6-150	Cover strip	M 502 B (P)	

4. Dimensional inspection

A. General

(1) Measuring instruments

Choice of the measuring instrument must be made in relation to the precision desired.

(a) Instrument classification

Two kinds of measuring instruments are to be distinguished :

- standard and universal inspection tools such as: slide gages, micrometers, depth gages, miscellaneous dial gages, etc.

This equipment is part of the provisioning items, is procurable in the trade and require no particular comment, provided that it is available in the required quantity and precision and satisfies, to the requirements for the work to be undertaken.

- Special inspection equipment such as : bases, supports, rigs, jigs, etc.

These tools are identified by a type number in the manual text, at the exact place where they are used.

(b) Calibration

Measuring instruments used in overhaul are to be checked periodically according to a procedure defined in relation to master instruments (SNECMA to be informed of procedure), themselves checked against the official master instruments of the country concerned.

INSPECTION
72-54-01Page 304
Jul 1/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

The Official Control Authorities of the countries where repairs are carried out will have to take steps to ensure that the repairer has set up suitable structure and equipment.

In the absence of a procedure in the countries concerned, the repairer will request from SNECMA the procedure applied in their workshop.

B. Dimensional inspection of parts

Details concerning the dimensional inspection and the acceptance criteria are given in paragraph 5 "Parts inspection".

5. Parts inspection

A. Drain fuel pipe (6-10)

(1) Visual inspection

- (a) Deterioration of the union threads entails renewal of the union.
- (b) Local distortion of the cup is acceptable on condition that it is located in the zone with bent edges. In such case, re-shape the cup.

(2) Inspection for soundness

- (a) Cracks located in the weld beads joining the various components must be eliminated by filling up with weld.

B. Spherical joint flange (6-180)

(1) Visual inspection

- (a) Wear marks located in the area which mates with the reheat duct are acceptable after blending using emery cloth.
- (b) Thread deterioration of the bush fitted to the riveted boss is cause for renewal of the bush, according to REP 6-180-3.
- (c) Thread deterioration of the tapped holes located in all the bosses is cause for restoration of the parts by installation of bushes.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (d) Deterioration of nuts providing for retention of the cover strip, is cause for nut renewal in accordance with REP 6-180-2.
- (2) Inspection for soundness
- (a) Cracks progressing in weld beads of bosses and flanges must be repaired through fill-up welding in accordance with REP 6-180-1
- (3) Dimensional inspection
- (a) Increase in the average inner diameter of the rear flange, measured in planes P1 and P2, at a temperature of 20° C is :
- . acceptable if average diameter is less than or equal to 1037,1 mm (40.831 in.).
 - . unacceptable if average diameter is greater than 1037,1 mm (40.831 in.) and requires the reconditioning of the flange by metallization

CAUTION - A 10°C TEMPERATURE VARIATION RESULTS IN A 0,13 mm (0.00512 in.) DIFFERENCE ON THE FLANGE DIAMETER.

Inspection method (see figure 301)

The average inner diameter of the rear flange in plane P1 then in plane P2, is found by working out the arithmetical mean of the 18 values recorded in the plane concerned.

For these measurements, proceed as follows :

Mark on the inner diameter 18 generatrices equally distributed on the rear flange half circumference.

CAUTION - IN ANY CASE, MARKING MUST NOT DETERIORATE THE SURFACE CONDITION OF THE FLANGE INNER DIAMETER.

- . Round the flange inner diameter using the resizing tool - SC 118.
- . Calibrate the TESA, UNIMASTER gage (TESA S.A.- 1020 - RENENS -VD/SWITZERLAND Agent in France : SYNERGIE, 27 avenue Philippe Auguste 75011 PARIS - Tél. 357.21.00).

INSPECTION
72-54-01

Page 306
Jul 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

SNECMA

Fit the gauge with :

- . the extension tubes required for obtaining the dimension to be checked.
- . the supports that are correctly adjusted to ascertain the measuring plane (P1 then P2).
- . Bear the gauge supports on to the flange edge, then measure.
- . Repeat this operation at the level of the 18 marks.

C. Cover strip (6-150)

(1) Visual inspection

- (a) Distorted condition of the tabs providing for attachment of the cover strip is unacceptable. If distortion is not associated with cracking, re-shape the tab ; otherwise renew the tab in accordance with REP 6-150-3.
- (b) Local distortion in the cover strip is unacceptable and requires re-shaping in accordance with REP 6-150-1.

(2) Inspection for soundness

- (a) Cracks progressing in the cover strip attachment tabs are unacceptable. Renew tabs in accordance with REP 6-150-3
- (b) Cracks affecting the cover strip may be either :
 - 1 weld filled according to REP 6-150-2, if they are isolated and lying in a non-oxidized zone,
 - 2 or patch repaired according to REP 6-150-4, if the filler welding method is not practicable.

INTERNAL ACCESSORY DRIVES - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.
- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

OVERHAUL

- (b) Any number of grooves, provided that they are all contained within an arc not greater than 60 degrees of bore mean circumference, that maximum depth is not greater than 0.005 in. (0,130 mm) and that F.C.S. limits are not violated.

Accept.

(3) Distortion.

- (a) Provided that minimum local clearance is not more than 0.006 in. (0,150 mm) below the minimum permissible dimension in the F.C.S.

Accept.

C. Inspect Labyrinth Seal.

(1) Fin damage.

- (a) Any damage greater than (b).

Accept after repair.

NOTE: Any damage greater than (b) may require reforming (Ref.72-61-00 Repair No.1).

- (b) Damage to fins.

Accept after repair provided, that only one blend is made to each fin, that finished blends are not more than one-half fin depth deep or five times fin depth long, that all blends on adjacent blades are separated radially by not less than five times fin depth at their ends, and that F.C.S. limits are not violated.

(2) Nicks and burrs.

Accept after repair.

D. Inspect Knocker Lobes.

- (1) Nicks and burrs.

Accept after
repair.

E. Inspect Locking Washer Locations.

- (1) Nicks and burrs.

Accept after
repair.

7. Bevel Zerol Gearshaft Assembly (302-40)

- A. Carry Out Dimensional Checks (Ref.72-61-00 Fits and Clearances F.C.S. 601-61/77, 602-415/418/420/423/428/431/432/435/439/441).

NOTE: Carry out these checks in conjunction with the following components, Labyrinth Probe (302-30), Oil Baffle (Ref. I.P.C.72-32-00/2-100), Spacer Sleeve (302-390), Roller Bearing (302-370), Ball Bearing (302-380), Roller Bearing (302-560), Roller Bearing (303-140), Ball Bearing (302-290), Spacer Sleeve (302-300), Roller Bearing (302-320), Inner Distance Piece (303-150), Ball Bearing (303-170).

- B. Inspect Threads (Ref.72-09-00 Inspection/Check).

- C. Inspect Splines (Ref.72-09-00 Inspection/Check).

- D. Inspect Gear Teeth (Ref.72-09-00 Inspection/Check).

- (1) Wear on non-working surfaces.

- (a) Fretting not more than
0.002 in. (0,050 mm)
in depth.

Accept after
repair.

- (2) Nicks and burrs on non-working
surfaces.

Accept after
repair.

- (3) Wear on working surfaces.

Accept subject to
F.C.S. checks on
assembly.

8. Adjusting Washer (302-50 to 170, 210 to 275, 410 to 460, 470 to 550 and 303-30 to 115)

NOTE: These items may require selection during assembly.

OVERHAUL

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores.

Accept provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

- (2) Fretting and wear.

Reject.

9. Bearing Housing (302-200)

- A. Carry Out Dimensional Checks (Ref.72-09-00 Fits and Clearances F.C.S. 602-429).

NOTE: Carry out these checks in conjunction with Ball Bearing (302-290).

B. Inspect Bearing Housing.

- (1) Nicks and burrs.

Accept after repair.

- (2) Wear.

- (a) Smooth wear within F.C.S. limits.

Accept.

- (3) Scoring.

- (a) Not more than 0.010 in. (0,250 mm) in depth.

Accept after repair providing repair does not violate F.C.S. limits.

10. Ball and Roller Bearings (302-290/320/370/380/560/, 303-140/170)

- A. Inspect Bearing (Ref.72-09-00 Inspection/Check).

- B. Carry Out Dimensional Checks (Ref.72-61-00 Fits and Clearances F.C.S. 602-416/417/418/420/421/422/426/427/428/429/430/431/433/434/435/441/442/443).

NOTE: Carry out these checks in conjunction with HP Drive Housing (302-570), Bevel Zerol Gears (302-40), Bearing Housing (303-180), Bevel Zerol Gear (303-20), Bearing Housing (302-200), HP Drive Housing (302-330).

11. Spacer Sleeves (302-300/390)

- A. Carry Out Dimensional Checks (Ref.72-61-00 Fits and Clearances F.C.S. 602-415/432).

NOTE: Carry out these checks in conjunction with Bevel Zerol Gear (302-40).

- B. Inspect Spacer Sleeves.

(1) Nicks and burrs.

Accept after
repair.

12. HP Drive Housing Assembly (302-330/570)

- A. Inspect Threads (Ref.72-09-00 Inspection/Check).

- B. Carry Out Dimensional Checks (Ref.72-61-00 Fits and Clearances F.C.S. 602-416/422/433).

NOTE: Carry out these checks in conjunction with Ball and Roller Bearings (302-320/370/380).

- C. Inspect Drive Housing.

(1) Nicks and burrs.

Accept after
repair.

(2) Wear.

(a) Bolt holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

(b) Smooth wear in bearing
location within F.C.S.
limits.

Accept.

D. Inspect Metaflex Seal Location.

(1) Damage. Reject.

E. Inspect Drive Shaft Tube.

(1) Dents (Ref.72-09-00 Inspection/Check Rigid Tubes).

(a) Dents at seal boss location. Reject.

(2) Wear.

(a) Fretting at seal boss location. Reject.

F. Inspect Attachment Flange.

(1) Nicks and burrs. Accept after repair.

(2) Scores.

(a) Not more than 0.010 in.
(0,250 mm) in depth. Accept after repair.

13. Metaflex Seal (302-345/590)

A. Inspect Metaflex Seal.

(1) Damage.

(a) Spot weld failure. Reject.

(b) Any other damage. Accept if checks during assembly are satisfactory.

14. Outer Spacer Sleeve (302-400)

A. Inspect Outer Spacer Sleeve Abutment Faces.

(1) Nicks and burrs. Accept after repair.

(2) Wear.

(a) Any fretting.

Reject.

15. Bevel Zerol Gear (303-20)

- A. Inspect Threads (Ref.72-09-00 Inspection/Check).
- B. Inspect Splines (Ref.72-09-00 Inspection/Check).
- C. Carry Out Dimensional Checks (Ref.72-61-00 Fits and Clearances F.C.S. 602-428/439/441).

NOTE: Carry out these checks in conjunction with Roller Bearing (303-140), Inner Distance Piece (303-150), and the Ball Bearing (303-170).

- D. Inspect Gear Teeth (Ref.72-09-00 Inspection/Check).

(1) Wear on non-working surfaces.

(a) Fretting not more than
0.002 in. (0.050 mm)
in depth.

Accept after
repair.

(2) Nicks and burrs on non-working
surfaces.

Accept after
repair.

(3) Wear on working surfaces.

Accept subject to
F.C.S. checks on
assembly.

16. Inner Distance Piece (303-150)

- A. Carry Out Dimensional Check (Ref.72-61-00 Fits and Clearances F.C.S. 602-439).

NOTE: Carry out this check in conjunction with the Bevel Zerol Gear (303-20).

- B. Inspect Distance Piece Abutment Faces.

(1) Wear.

(a) Any wear.

Reject.

(2) Nicks and burrs.

Accept after
repair.

17. Outer Distance Piece (303-160)

- A. Carry Out Dimensional Check (Ref.72-61-00 Fits and Clearances F.C.S. 602-444).

NOTE: Carry out this check in conjunction with the Bearing Housing Assembly (303-180).

- B. Inspect Distance Piece Abutment Faces.

(1) Wear.

(a) Any wear.

Reject.

(2) Nicks and burrs.

Accept after repair.

18. Bearing Housing Assembly (303-180)

- A. Carry Out Dimensional Checks (Ref.72-61-00 Fits and Clearances F.C.S. 602-426/443/444).

NOTE: Carry out these checks in conjunction with Roller Bearing (303-140), Ball Bearing (303-170) and Outer Distance Piece (303-160).

(1) Alignment.

(a) Bearing housing mounting flange not normal to bearing location axis.

Reject.

- B. Inspect Bearing and Distance Piece Locations.

(1) Scores.

(a) Not more than 0.005 in. (0,130 mm) in depth.

Accept after repair providing repair does not violate F.C.S. limits.

(2) Nicks and burrs.

Accept after repair providing repair does not violate F.C.S. limits.

- C. Inspect Retaining Ring Groove.

(1) Nicks and burrs.

Accept after repair.

D. Inspect Bearing Housing Mounting Flange.

(1) Wear.

- | | | |
|-----|--|----------------------|
| (a) | Reduction of material thickness not more than 10 per cent. | Accept. |
| (b) | Bolt holes elongated not more than 0.015 in. (0,380 mm). | Accept after repair. |

(2) Scores.

- | | | |
|-----|---|----------------------|
| (a) | Not more than 0.005 in. (0,130 mm) in depth at bolt head locations. | Accept after repair. |
|-----|---|----------------------|

(3) Nicks and burrs.

Accept after repair.

(4) Distortion.

- | | | |
|-----|--------------------------------|---------|
| (a) | Any distortion from true form. | Reject. |
|-----|--------------------------------|---------|

19. Housing Support (303-210)

A. Inspect Housing Support.

(1) Wear.

- | | | |
|-----|---|----------------------|
| (a) | Reduction of material thickness of not more than 10 per cent. | Accept. |
| (b) | Bolt holes elongated not more than 0.015 in. (0,380 mm). | Accept after repair. |

(2) Scores.

- | | | |
|-----|---|----------------------|
| (a) | Not more than 0.010 in. (0,250 mm) in depth at bolt head locations. | Accept after repair. |
|-----|---|----------------------|

(3) Nicks and burrs.

Accept after repair.

20. Self-locking Nuts (302-190/360, 303-10)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

- | | | |
|----|---|------------------------------------|
| B. | Inspect the self-locking feature of each nut to ensure that it has an elliptical feature and not a four lobe feature (Ref.SB.72-105). | Reject any four lobe featured nut. |

LEFT-HAND ACCESSORY GEARBOX, ASSEMBLY - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

4. Adjusting Shim (302-10 to 65/140 to 185/220 to 275/320 to 355)

NOTE: These items will require selection during assembly.

A. Inspect Abutment Faces.

(1) Nicks, burrs and scores.

Accept, provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

(2) Fretting and wear.

Reject.

5. Gearbox Mounting Bracket Assemblies (302-130/310)

A. Inspect Shank Self-locking Nuts (Ref.72-09-00 Inspection/Check).

B. Inspect Attachment Faces.

(1) Wear.

- (a) Not more than 10 per cent reduction of flange thickness.

Accept after repair providing surface flatness is maintained.

- (b) Bolt-holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

- (c) Hollow pin holes elongated.

Reject.

(2) Scores.

- (a) Not more than 0.010 in. (0,250 mm) in depth on contact faces.

Accept after repair providing flange thickness is not reduced by more than 10 per cent.

C. Inspect General Condition of Mounting Bracket.

- (1) Nicks and burrs.

Accept after repair.

6. Coupling Flange (303-50, 307-40)

A. Inspect Gearbox Attachment Face.

- (1) Nicks, burrs, scores and wear.

Accept after repair providing sealing capabilities are unimpaired.

- (2) Wear at bolt locations.

- (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

B. Inspect Corruplus Seal Groove.

- (1) Nicks and burrs.

Accept after repair.

(2) Wear.

- (a) Light witness marks provided that surface roughness in grooves is not more than 50 micro inches (1,25 micrometres).

Accept after repair provided that sealing capabilities are unimpaired.

C. Inspect Coupling Ring Assembly Retaining Flange.

- (1) Nicks, burrs, scores and wear.

Accept after repair providing 90 per cent of effective flange thickness is maintained.

D. Inspect General Condition of Coupling Flange.

- (1) Nicks and burrs.

Accept after repair.

- (2) Wear and scores.

- (a) Light wear and scoring at bolthead locations.

Accept after repair.

7. Coupling Ring Assembly (303-60, 307-50)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Anvils.

- (1) Nicks and burrs.

Accept after repair.

C. Inspect Coupling Interrupted Threads.

- (1) Using a new standard mating component, check the compatibility of the interrupted thread to ensure adequate torque clearance between the spherical nut and the retaining bracket.

- (2) Nicks and burrs.

Accept after repair.

- (3) Wear.

- (a) Fretting not more than 0.001 in. (0,030 mm) in depth.

Accept after repair providing compatibility is preserved.

9. Support Brackets (304-20, 306-50B, 308-190B)

A. Inspect Attachment Face.

(1) Wear and fretting.

(a) Not more than 10 per cent reduction in flange thickness. Accept after repair.

(b) Bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

(2) Scores.

(a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair providing material thickness is not reduced by more than 10 per cent.

B. Inspect Bracket.

(1) Nicks and burrs. Accept after repair.

(2) Distortion. Accept if compatibility is preserved.

10. End Plate (304-30, 306-60, 308-270) and Retaining Bracket (307-150)

A. Inspect Abutment Face.

(1) Wear.

(a) Not more than 10 per cent reduction in flange thickness. Accept after repair.

OVERHAUL

- (4) Check overall bearing diameters as follows.

NOTE: Figures 601 and 602 (Ref.72-62-00 Fits and Clearances) are to SB.72-7510-166 standard. For dimension location purposes however, positions 601-275/276/277 and 602-311/312/313 are used for Pre SB.72-7510-166 reference.

Bearing Identity	F.C.S. Reference
310-160	602-303
310-360 (Pre SB.72-7510-166)	601-275
311-20	602-291
311-50	602-307
311-130	601-279
312-240	602-310
312-380A (Pre SB.72-7510-166)	602-312

(a) Within F.C.S. limits. Accept.

- (5) Check diametral clearances and end-float as follows.

Bearing Identity	F.C.S. Reference
310-160	602-302
310-360 (Pre SB.72-7510-166)	601-277
311-20	602-292
311-50	602-305
311-130	601-280
312-240	602-309
312-380A (Pre SB.72-7510-166)	602-311

(a) Within F.C.S. limits. Accept.

(6) Check bearing bore as follows.

Bearing Identity	F.C.S. Reference
310-160	602-301
310-360 (Pre SB.72-7510-166)	601-276
311-20	602-293
311-50	602-306
311-130	601-281
312-240	602-308
312-380A (Pre SB.72-7510-166)	602-313

(a) Within F.C.S. limits. Accept.

B. Inspect Bearing (Ref.72-09-00 Inspection/Check).

(1) Wear.

- | | |
|--|----------------------|
| (a) Not more than 5 per cent reduction in flange thickness. | Accept after repair. |
| (b) Bolt-holes elongated not more than 0.030 in. (0,760 mm). | Accept after repair. |

32. Integral Bearing (310-260B and 312-380B) (SB.72-7510-166)
(310-260C) (SB.72-8651-246)

A. Dimensional Checks (Ref.72-62-00 Fits and Clearances).

(1) Dimensionally check Integral Bearing (310-260B) in conjunction with the Gearbox Case (309-10) (para.23) and Spiral Bevel Pinion (310-133) (para.29 or 30).

(a) Within F.C.S. limits. Accept.

(2) Dimensionally check Integral Bearing (312-380B and C) in conjunction with the Gearbox Case (309-10) (para.23) and Bevel Zerol Gear Pinion (312-140) (para.40).

(a) Within F.C.S. limits. Accept.

(3) Check overall bearing diameters as follows.

Bearing Identity	F.C.S. Reference
310-260B	601-270/275
310-260C	601-270-275
312-380B	602-312

(a) Within F.C.S. limits. Accept.

(4) Check diametral clearances and end-float as follows.

Bearing Identity	F.C.S. Reference
310-260B	601-277
310-260C	601-277
312-380B	602-311

(a) Within F.C.S. limits. Accept.

(5) Check bearing bore as follows.

Bearing Identity	F.C.S. Reference
310-260B	601-276
310-260C	601-276
312-380B	601-313

(a) Within F.C.S. limits. Accept.

B. Inspect Bearing Housings (Ref.72-09-00 Inspection/Check).

(1) Wear.

- | | |
|--|----------------------|
| (a) Not more than 5 per cent reduction in flange thickness. | Accept after repair. |
| (b) Bolt-holes elongated not more than 0.030 in. (0,760 mm). | Accept after repair. |

33. Driving Shaft (310-180)

A. Inspect Splines (Ref.72-09-00 Inspection/Check).

B. Inspect Retaining Ring Groove.

- (1) Nicks and burrs. Accept after repair.
- (2) Fretting on adjacent lands.
 - (a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair.

C. Inspect Flanged Ring.

- (1) Nicks and burrs. Accept.

D. Inspect Shaft.

- (1) Nicks and burrs. Accept after repair.
- (2) Bowing.
 - (a) Any signs of bowing. Reject.

34. Spacer Sleeve (310-350, 312-390)

A. Inspect Abutment Faces.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
 - (a) Not more than 0.005 in. (0,130 mm) in depth. Accept after repair providing 90 per cent of effective circumference is maintained.

35. Idler Spur Gear (311-60)

A. Carry Out Dimensional Checks (Ref.72-62-00 Fits and Clearances F.C.S.602-293/306).

- (1) Dimensionally check this component in conjunction with the Parallel Roller Bearing Journals (311-20/50) (para.31).
 - (a) Within F.C.S. limits. Accept.

B. Inspect Threads (Ref.72-09-00 Inspection/Check).

C. Inspect Gear Teeth.

(1) Wear on non-working surfaces.

(a) Fretting not more than
0.002 in. (0,050 mm)
in depth.

Accept after
repair.

(2) Nicks and burrs on non-working
surfaces.

Accept after
repair.

(3) Wear on working surfaces.

Accept subject to
checks on assembly.

D. Inspect Bearing Locations.

(1) Nicks and burrs.

Accept after
repair.

(2) Scores.

(a) Not more than 0.010 in.
(0,250 mm) in depth.

Accept after repair
providing F.C.S.
limits are not
violated.

(3) Wear.

(a) Not more than 0.002 in.
(0,050 mm) in depth.

Accept after repair
providing F.C.S.
limits are not
violated.

36. Cupwasher (311-80, 312-20/260)

A. Inspect Cupwasher (Ref.72-09-00 Inspection/Check).

37. Quillshaft (311-140)

A. Carry Out Dimensional Checks (Ref.72-62-00 Fits and
Clearances F.C.S.601-286).

RIGHT-HAND ACCESSORY GEARBOX ASSEMBLY - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

NOTE: These items will require selection during assembly.

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores.

Accept provided
that repair
preserves surface
flatness and that
designed effective
thickness is main-
tained over 90 per
cent of contact
face area.

- (2) Fretting and wear.

Reject.

5. Nut Retainer (302-80)

A. Inspect Nut Retainer.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
 - (a) Any wear in nut retaining locations. Reject.
 - (b) Bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.
- (3) Distortion. Accept providing compatibility is preserved.

6. Hollow Headed Pin (302-100/230)

A. Inspect Mounting Bracket Abutment Face.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
 - (a) Fretting not more than 0.005 in. (0,130 mm) in depth. Accept after repair providing designed effective flatness is maintained over 90 per cent of face area.

B. Inspect Hollow Headed Pin.

- (1) Scores.
 - (a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair.

7. Gearbox Mounting Bracket (302-110/240)

A. Inspect Intermediate Case Attachment Flange.

- (1) Nicks and burrs. Accept after repair.

8. Coupling Ring Assembly (304-70, 309-80)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Anvil.

(1) Nicks and burrs.

Accept after
repair.

C. Inspect Coupling Interrupted Thread.

NOTE: Using a new standard mating component, check the compatibility of the interrupted thread to ensure adequate torque clearance between the spherical nut and the mounting bracket.

(1) Nicks and burrs.

Accept after
repair.

(2) Wear.

(a) Fretting not more
than 0.001 in.
(0,030 mm) in depth.

Accept providing
compatibility is
preserved.

D. Inspect Spherical Nut Location.

(1) Security.

(a) Spherical nut secure
in its location and
free to move within
bounds of locking
pins.

Accept.

9. Mounting Bracket (304-120, 309-160)

A. Inspect Abutment Flange.

(1) Wear.

(a) Not more than 10 per
cent reduction in
flange thickness.

Accept after
repair.

DRIVE, PULSE PROBE AND HOUSING - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.
 - (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

MAIN OIL PUMP - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

8. Strainer Assembly (303-50) Pre SB.72-49, Outer Element Assembly (303-57) SB.72-49 and Inner Element Assembly (303-59) SB.72-49

NOTE: Where the strainer (303-50) is to Pre SB.72-49 standard, ensure that the strainer does not exceed 5.400 ± 0.010 in. ($137,16 \pm 0,25$ mm) in length. Where the length of the strainer is in excess of the above limits, refer to SB.72-112 for the rectification procedure.

A. Inspect Screen.

(1) Damage.

(a) Punctures, tears or separation from the cage. Reject.

(b) Damaged or faulty brazed joints. Reject.

B. Inspect Cage.

(1) Cracks and distortion. Reject.

(2) Nicks, burrs and scores. Accept if unbroken contact is maintained after repair.

C. Inspect Filter Cover and Spring Location.

(1) Scores, nicks and burrs. Accept after repair.

D. Inspect End Face.

(1) Scores, nicks and burrs. Accept after repair.

9. Magnetic Screwed Plug (303-70)

NOTE: This item is not a standard fitting.

A. Inspect Thread (Ref.72-09-00 Inspection/Check).

OVERHAUL

B. Test Magnetic Plug For Magnetism.

- (1) Examine the probe for defects.
- (2) The probe must be capable of lifting three unmagnetised steel 0.5 in. (13 mm) diameter balls.
- (3) Assemble a protective sleeve to the probe and place the magnetic plug in a suitable container.
 - (a) Within testing limits. Accept.

10. Drain and Valve Body Assembly (303-90)

A. Inspect Thread (Ref.72-09-00 Inspection/Check).

B. Inspect Valve Body.

- (1) Nicks and burrs. Accept providing sealing capability is maintained after repair.

C. Check Spring Action.

- (1) Check spring action by manually depressing valve and ensuring its return under spring pressure.

D. Inspect Pressure Pump Case Sealing Face.

- (1) Scoring.
 - (a) Not more than 0.005 in. (0,130 mm) deep and not extending more than half-way across face. Accept after lapping providing sealing capabilities are maintained.

11. Inner and Outer Strainer Assembly (303-100/110)

A. Inspect Thread (Ref.72-09-00 Inspection/Check).

B. Inspect Screen.

- (1) Punctures, tears or separation from cage. Reject.

C. Inspect Cage.

- (1) Cracks and distortion. Reject.

OVERHAUL

(2) Nicks, burrs and scores.

Accept providing
unbroken contact
is maintained
after repair.

D. Inspect Inner and Outer Strainer Locations.

(1) Damage to inner strainer
centralising clips located
in the outer strainer bore.

Accept, if assembly
is satisfactory
after repair.

(2) Nicks, burrs and scores.

Accept after
repair.

12. Spring (303-120 and 303-54 SB.72-49)

A. Inspect Spring.

(1) Check spring compression load of each spring (Ref.
72-65-00 Fits and Clearances F.C.S.601-456 and -457).
Use spring test equipment (Ref.72-09-00 Inspection/
Check).

(a) Within F.C.S. limits.

Accept.

13. Filter Cover (304-30)

A. Inspect Abutment Face.

(1) Nicks, burrs and scores.

Accept after repair
providing sealing
capability is not
impaired.

B. Inspect Cover.

(1) Nicks, burrs and scores.

Accept after repair
providing sealing
capability is not
impaired.

14. Jet (304-40)

A. Inspect Thread (Ref.72-09-00 Inspection/Check).

B. Inspect Abutment Face.

(1) Nicks, burrs and scores.

Accept after
repair.

15. Sediment Strainer (304-60)

A. Inspect Thread (Ref.72-09-00 Inspection/Check).

B. Inspect Abutment Locations.

(1) Nicks, burrs and scores.

Accept after
repair.

C. Inspect Strainer Element.

(1) Dents, fractures and
separation from end pieces.

Reject.

16. Check Valve Cover (304-80)

A. Inspect Abutment Face.

(1) Nicks, burrs and scores.

Accept after
repair providing
sealing capabil-
ity is not
impaired.

B. Inspect Distance Piece Locating Dogs.

(1) Distortion and fractures.

Reject.

(2) Nicks and burrs.

Accept after
repair.

C. Inspect Cover.

(1) Nicks, burrs and scores.

Accept after
repair if sealing
capability is
unimpaired.

17. Spring (304-100)

A. Inspect Spring.

(1) Check spring compression load (F.C.S.601-458).
Use spring test equipment (Ref.72-09-00 Inspection/
Check).

(a) Within F.C.S. limits.

Accept.

18. Check Valve (304-110)

A. Inspect Sealing Face in area of Witness Mark.

- (1) Nicks, burrs and scores. Accept after lap-
ping if leakage
check is satis-
factory in
conjunction with
304-470 (Ref.
72-65-00,
Testing).
- (2) Surface flatness. (Use helium light band equipment,
Ref.72-09-00 Inspection/Check).
- (a) Flatness more than three Accept after lap-
helium light bands. pping providing
leakage check is
satisfactory
(Ref.72-65-00,
Testing).
- (b) Flatness within three helium Accept.
light bands.

B. Inspect Spring Location.

- (1) Fretting. Accept after
repair.

19. Quillshaft (304-120 and 304-500)

A. Inspect Splines (Ref.72-09-00 Inspection/Check).

B. Carry out Dimensional Checks (Ref.Fig.307).

NOTE: Carry out these checks in conjunction with the
gear splines (para.20.A.).

- (1) Check overall spline backlash clearances (Ref.
72-65-00, Fits and Clearances) as follows:

Quillshaft Identity	F.C.S. Reference
304-120	602-477
304-500	601-460
	602-482/492/494

- (2) Nicks and burrs. Accept after
repair.

20. Pump Gears (304-400/410/480/490, 305-100/110/170/180/280/
300 and 6-130)

A. Inspect Splines (Ref.72-09-00 Inspection/Check).

B. Carry out Dimensional Checks (Ref.Fig.307).

NOTE: Carry out the following checks in conjunction
with the quillshafts (para.19.B.).

- (1) Check overall spline backlash clearances
(Ref.72-65-00 Fits and Clearances) as follows:

Gear Identity	F.C.S. Reference
304-410	602-477/482
304-490	602-492
305-110	602-494
306-130	602-460

C. Inspect Journals.

- (1) Nicks, burrs and scores.

Accept if
repair does not
violate F.C.S.
limits in para.F.
and subject to
satisfactory pump
rig test (Ref.
72-65-00).

- (2) Wear and fretting.

- (a) Even wear, with no
stepping, within F.C.S.
limits.

Accept subject
to para.F.

D. Inspect Gear Teeth (Ref.72-09-00, Inspection/Check).

- (1) Nicks and burrs.

Accept, if repair
does not violate
F.C.S. limits in
para.F.

- (2) Wear and fretting.

- (a) Stepped, or more than
0.005 in. (0,130 mm) deep.

Reject.

STANDARD PRACTICES - REPAIR

1. General

- A. Repair consists of working on defective components in order to bring them up to a satisfactory standard for achieving a further overhaul life. Repair procedures may also be applied to components for reasons other than repair, e.g. removing and re-applying protective finishes to facilitate crack detection.
- B. General repair procedures are detailed subsequently in this Chapter, while all forms of finishes are detailed under their own subject number 72-09-01, 02 etc. (Ref. Repair Table of Contents). Special repair procedures, areas of finishes, dressing of damage etc. for individual components are detailed in the Chapter applicable to the assembly concerned.
- C. Any necessary work shall comply with the requirements of the relevant Inspection Report. Satisfactory completion of repair shall be inspected and signed for by a qualified inspector.
- D. The processes for carrying out certain repairs may contain Controlled Manufacturing Technique (CMT) procedures. These procedures are mandatory and variations are prohibited. All repairs so affected are identified by a CAUTION at the commencement of the repair procedure.

2. Repair Illustrations

A. Geometric Tolerances.

- (1) All geometric tolerances shown conform to the International Standards Organization (I.S.O.) Geometric Tolerance System.

B. Dimensional Tolerances.

- (1) Unless otherwise stated on a particular illustration, the following tolerances shall be observed.

- (a) Machined dimensions ± 0.010 in.
 $(\pm 0,25 \text{ mm})$
- (b) Diameter of drilled holes ... $\pm 0.010 - 0.002$ in.
 $(+ 0,25 - 0,05 \text{ mm})$
- (c) Angles ± 2 deg

- (2) All dimensions apply at an ambient temperature of 20 deg C. Due allowance shall be made when checking dimensions at an ambient temperature other than that stated.

OVERHAUL

Examples of Typical Surface Roughness Symbols and Values
Figure 401

JN24976

OLYMPUS 593

MK.610-14-28

OVERHAUL

C. Surface Roughness.

- (1) Surface roughness is indicated by a symbol and adjacent numbers which represent the average departure from perfection of the surface over a prescribed length, usually 0.030 in. (0,8 mm). The roughness values are identical to Centre Line Average (CLA) and Arithmetical Average (AA) values. Refer to Fig.401 for examples of typical surface roughness symbols and values.
- (2) Refer to Inspection/Check for methods of inspecting for surface roughness.

3. Permanent Marking

A. General.

- (1) Permanent marking is used to mark repair scheme numbers and similar identification numbers or symbols on components. Recommended methods of marking are detailed subsequently.
- (2) Unless otherwise stated, the method used, and the size and style of the symbols should be the same as existing markings, and the markings close to the existing ones.
- (3) When a marking supersedes a previous one, the superseded one shall be cancelled by a single line-through so that it remains legible for reference purposes.
- (4) Markings shall not be applied to running, mating or highly stressed surfaces. Neither shall they be applied near component edges, corners, fillet radii or similar locations.

B. Repair Scheme Marking.

Each repair instructs the marking of the repair scheme number (e.g. SAL. B.478105) (Ref. Contents 72-51-04 Repair) close to the existing part number of the component. Where space is limited, an abbreviated Repair No. of the SAL. Scheme No. may be used as an alternative (e.g. Repair No.1 to R.1).

When the repair scheme is a collective repair (e.g. B.478108-10) each component number must be identified by a letter following the Repair No. (e.g. SAL. B.478108-10 becomes R.2A, R.2B and R.2C).

REPAIR

72-09-00

Page 403

Aug 1/77

**OLYMPUS 593**

MK.610-14-28

OVERHAUL

In addition, when a repair scheme is carried out more than once on a component, it must be identified by the addition of the letter 'X' after the number or letter, for each additional application after the first (e.g. R.1X for the second application and R.2AXX for the third application on the collective repair).

C. Acid Etching.

- (1) This method consists of applying acid to the surface of the component using rubber stamps, and allowing the acid to etch the surface for a sufficient time to give legible symbols. It is suitable for case-hardened and nitrided steels, Nimonic alloy steels and corrosion-resisting steels.

WARNING: WEAR PROTECTIVE CLOTHING AND OBSERVE THE APPROPRIATE INDUSTRIAL REGULATIONS WHEN HANDLING DANGEROUS CHEMICALS.

CAUTION: DO NOT USE RUBBER STAMPS EMPLOYED WITH ETCHING SOLUTIONS FOR ANY OTHER MARKING PURPOSES.

- (2) The composition of the etching solution is dependent upon the type of steel to be marked.

- (a) For case-hardened steel the solution comprises:

Selenious acid	20 g
Copper sulphate (crystals) ...	10 g
Nitric acid (concentrated) ...	15 ml
Water	80 ml

- (b) For nitrided steels, Nimonic alloy steels and corrosion-resisting steels the solution comprises:

Selenious acid	20 g
Copper sulphate (crystals) ...	10 g
Nitric acid (concentrated) ...	25 ml
Hydrochloric acid	60 ml
Water	10 ml

- (3) Immediately after etching the markings shall be neutralized, the component thoroughly washed and then protected against corrosion by the application of an approved de-watering oil.

D. Vibro-percussion Engraving.

- (1) This method consists of marking the surface of the component with a series of small impressions using an electrically operated hammer. It is suitable for general application except in highly-stressed locations.

REPAIR

72-09-00

Page 404

Aug 1/77

TN8749

OLYMPUS 598

MK.610-14-28

OVERHAUL

- (2) The marking produced should be as light as possible, consistent with legibility. The stylus tip radius shall be 0.020 in. (0,51 mm) minimum to avoid possible reduction of fatigue strength in the component.

E. Electro-chemical Marking.

- (1) Marking by this method is applicable to all metals provided the surface is not covered by a low-conductivity layer, e.g. anodizing, etc. It consists of passing a d.c. and/or a.c. current between a pen and the component. Interposed between the two is a pad soaked in electrolyte and a stencil to produce the required symbols.
- (2) Surfaces to be marked should be free from contamination and reasonably smooth and bright, or slightly roughened as obtained by vapour blasting. Light oiling of the surface helps in preventing blurring of the symbols.
- (3) If a typed stencil is used, it should be cut to a size slightly larger than the pad. The pad should be soaked in the electrolyte and allowed to drain, then affixed, together with the stencil (with its backing paper removed), to the pen using a rubber band.
- (4) The current setting and timing device shall be set before the pen is pressed against the surface to be marked. The application pressure should be light to avoid blurring the symbols.
- (5) After marking the surplus electrolyte should be wiped up, the surface neutralized if required, and the component protected against corrosion by the application of an approved de-watering oil.
- (6) Faulty markings may be removed by abrading with a nylon pad, e.g. Scotchbrite.
- (7) Refer to Table 401 for recommended electrolytes. With the exception of EM.16, the electrolytes, together with pens, pads and stencils, are obtainable from Lectroetch Ltd., Spur Road, North Feltham, Middlesex, England. EM.16 is obtainable from Rolls-Royce Limited, Aero Division, P.O. Box 3, Filton, Bristol BS12 7QE, England.

- (8) After use, pads shall be neutralized, washed in water
and dried. Different pads shall be used with
different electrolytes and, preferably, different
metals.

4. Renewing Helicoil Inserts

A. General.

- (1) The following procedure must be used when renewing
defective Helicoil screw locking inserts.
- (2) The special tools illustrated in the procedure must
be used to avoid damaging the insert and/or component.
These tools are detailed in Tables 402 and 403.
- (3) Refer to Table 406 for the Trouble Shooting Chart,
which highlights problems experienced with Helicoil
inserts and their possible causes and remedies.

OVERHAUL

B. Remove the Defective Insert.

- (1) Apply the extraction tool as shown (Ref.Fig.402), lightly tap it with a 6 to 8 oz (170 to 230 g) hammer then rotate the tool counter-clockwise to withdraw the insert.
- (2) Scrap the extracted insert; under no circumstances shall extracted inserts be reinstalled.
- (3) Examine the tapped hole for cleanliness and freedom from damage.

Helicoil Inserts
Table 403

C. Install the New Insert.

- (1) Select a new insert of the correct Part No. for the particular application.
- (2) Withdraw the threaded mandrel of the inserting tool and place the insert in the loading chamber (Ref.Fig.403, detail A).
- (3) Preventing the insert from moving using the thumb, screw the threaded mandrel into the insert until the driving feature engages the insert tang (Ref.detail B).

(4) Continue turning the mandrel whilst pushing forward gently until the insert enters the thread in the tool nozzle. Wind the insert into the nozzle until it is about to emerge from the open end (Ref. detail C).

(5) In aluminium and magnesium components, apply a coating of PL32L jointing compound to the tapped hole.

NOTE: The coating of jointing compound prevents electrolytic corrosion between the insert and the component.

(6) Place the loaded tool squarely over the tapped hole in the component and screw in the mandrel carefully until the insert enters the hole. Continue screwing until the insert is at the required depth as detailed in para.4.E. (Ref. detail D).

(7) Unscrew the mandrel until it is clear of the insert (Ref. detail E).

D. Remove the Tang.

CAUTION: IF THE INSERT IS INSTALLED IN A THROUGH HOLE, TAKE APPROPRIATE PRECAUTIONS TO PREVENT THE REMOVED TANG FROM BECOMING LOST WITHIN THE ENGINE.

(1) Place the tang break-off tool into the insert and allow the punch to rest on the tang (Ref. Fig. 404).

(2) Holding the sleeve firmly, deliver a sharp blow on the end of the punch using a 6 to 8 oz (170 to 230 g) hammer.

NOTE: The tang will break off cleanly at the notch.

(3) Remove the tool and retrieve the tang immediately.

NOTE: All tangs are to be accounted for, with reference to the number of inserts installed.

E. Inspect the Installed Insert.

(1) Check the depth of the insert below the component surface (Ref. Fig. 405). Unless otherwise stated the depth shall be as shown on the illustration. Refer to Table 404 for interpretation of standard depths.

Interpretation of Helicoil Insert Standard Depths
Table 404

- (2) Check the insert for cross threading.
 - (a) On inserts of sizes 0.5 in. and below, install the appropriate probe gauge to the full insert depth (Ref.Fig.406).
 - (b) On inserts of sizes above 0.5 in., check for cross threading visually.
- (3) Check the insert for minimum locking (run-down) torque.
 - (a) Preset the torque-limiting driver or torque wrench to the required minimum locking torque value (Ref. Table 405).
 - (b) Assemble the driver or wrench, adapter and appropriate torque check gauge.

OVERHAUL

5. Renewing Self-Locking Nut and Clip Assemblies

- A. To renew self-locking nut and clip assemblies, the procedure illustrated in Fig.408 shall be used.

6. Reconditioning Cupwashers

NOTE: This procedure is only applicable if the rim of the cupwasher is unused for a sufficient length to give a minimum space of two nut slots between the new locking locations and any previous locking locations. If this condition cannot be met, the cupwasher shall be rejected.

- A. Scallop the rim of the cupwasher at previous locking locations to approximately one quarter of the cupwasher depth (Ref.Fig.409).

B. Radius and dress the edges and corners of the scallop.

NOTE: Witness of the previous locking is permissible after scalloping and dressing.

7. Reconditioning Main Bearings

A. Ball Bearings.

- (1) Reconditioning is not permitted.

B. Roller Bearings.

- (1) Non-locating races may be interchanged provided that the replacement one is of the same type, manufacture, material and approximate life as the rejected one.
- (2) Rollers may be interchanged provided that:
 - (a) They are of the same type, manufacture, material and approximate life.
 - (b) They are not from a bearing which was rejected because of overheating.
 - (c) The variation in size and ovality of all the rollers in the set (including replacement ones) does not exceed 0.0001 in. (0,002 mm) when measured with an instrument having an accuracy in the order of 0.00001 in. (0,0002 mm).
- (3) After substitution of races and/or rollers the assembled bearing must comply with the limits specified in FCS.

8. Renewing Locating Pins

A. Aluminium Components.

- (1) Heat the component to 100 deg C and withdraw the pin.

CAUTION: WHEN DRILLING PINS, ENSURE THAT THE DRILL DOES NOT BREAK INTO THE COMPONENT.

- (2) If there is insufficient pin stand-out to grip, drill a suitable hole in the pin, heat the component to 100 deg C and use an extractor to withdraw the pin.

B. Other Components.

CAUTION: WHEN DRILLING PINS, ENSURE THAT THE DRILL DOES NOT BREAK INTO THE COMPONENT.

- (1) Drill the pin to a thin shell.
- (2) Collapse and remove the pin remains, taking care not to damage the hole.

9. Renewing Self-locking Shank Nuts

A. Remove the Defective Nut.

CAUTION: WHEN DRILLING NUTS, ENSURE THAT THE DRILL DOES NOT BREAK INTO THE COMPONENT.

- (1) Drill the shank of the nut to a thin shell.
- (2) Collapse the shank and withdraw the nut, taking care not to damage the hole.

B. Examine the Nut Location.

- (1) Examine the hole and nut abutment faces for burrs and/or debris liable to prevent nut from seating correctly.
- (2) Dress burrs by light stoning and clean the hole and nut abutment faces using a clean, lint-free cloth moistened with kerosine.

C. Install the New Nut (Ref.Fig.410).

- (1) Select a new nut of the correct type and remove any preservative using a clean, lint-free cloth moistened with kerosine.
- (2) Install the nut in the component flange, ensuring that it correctly abuts the flange face.

NOTE: The design of the swaging tool shown in Fig.410, 411 and 412 is not mandatory. However, the swaging tool used must embody the same principles and the same dimensions where specified.

- (3) Select the appropriate swaging tool and install the appropriate anvil; refer to Fig.411 for details of the tool head and to Fig.412 for details of the anvil.
- (4) Unscrew the tool driving screw and outer sleeve and place the tool in position over the nut as shown.
- (5) Carefully screw in the outer sleeve until the nut is held firmly against the flange.
- (6) Carefully screw in the driving screw to swage the nut shank.
- (7) Unscrew the driving screw and outer sleeve, then remove the swaging tool.

D. Inspect the Installed Nut (Ref.Fig.413).

- (1) Ensure that the nut shank is underflush to avoid fouling the mating components.
- (2) Check the nut for security: rotation of the nut up to the trap is permissible, but there must be no detectable axial movement.

NOTE: Damage to the silver coating inside the nut shank is normal and acceptable.

- (3) Remove any loose flakes of silver coating from inside the nut shank.
- (4) Check the locking (run-down) torque (Ref.72-09-00 Inspection/Check).
- (5) Renew nuts which fail any of the preceding checks.

10. Repair Categories and Technical Acceptability

A. General.

- (1) Repairs fall into categories for purposes of technical acceptability and the following information is included for operators who wish to raise their own repairs.

OLYMPUS 593
MK. 610-14-28
OVERHAUL

B. Category 1.

- (1) Repairs on vital parts, where a failure of that part may result in damage to the engine and thereby constitute a hazard to the airworthiness of the aircraft. This category includes all Group A parts but for the acceptability of Repairs may also include some Group B parts.
- (2) Repairs on these parts involve a detailed investigation into the design and stress parameters and may need proving by rig or engine testing. Repair proposals in this category must be referred to Rolls-Royce Ltd.

C. Category 2.

- (1) Repairs on parts, the failure of which may cause extensive secondary damage to the engine, e.g.
 - (a) Repairs on the main load carrying areas of basic structural parts, e.g. compressor casings, main bearing support structures etc.
 - (b) Repairs, particularly by welding, on parts which operate under high pressure and/or high temperature conditions where failure could result in a fire hazard, e.g. combustion casings, compressor outlet casings, exhaust system, by-pass ducts, etc., where failure could result in a fire hazard.
 - (c) Repairs using techniques which can result in a reduction of fatigue strength on highly stressed parts such as main shafts. Plating, metal spraying, electron beam and friction welding come under this heading.
- (2) Repairs in this category require the same type of investigation and proving as for category 1 and must be referred to Rolls-Royce Ltd., for agreement.

D. Category 3.

- (1) Repairs on parts, the performance of which is known to be sensitive to small changes, e.g.
 - (a) The effect which a welding repair on the combustion chamber may have on flame traverse.

TN30837

REPAIR

72-09-00

Page 426
Feb 1/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

(b) The effect which repairs to rotor blades may have on performance or vibration modes.

- (2) Repairs in this category may require rig or engine testing, or evaluation in service, to ensure that in addition to the reliability of the repaired part there are no adverse secondary effects on other parts of the engine. Reference should be made to Rolls-Royce Ltd., for agreement.

E. Category 4.

- (1) Repairs which require the design and manufacture of special parts, the development of a special technique, which is basic to the design standard of the part, or where interchangeability of the design standard is affected. These will be raised by Rolls-Royce Ltd., as routine.

F. Category 5.

- (1) Standard type repairs on parts or applications not covered in categories 1, 2, 3 or 4. Such repairs include plating, welding, metal spraying etc., where techniques are established and the basis for clearance is general service experience together with the information regarding materials, welding rods, heat treatments, inspection standard etc. contained in the appropriate Overhaul Processes, comparable Repairs and manuals published by Rolls-Royce Ltd.
- (2) Where an operator wishes to raise repairs in this category the necessary procedural arrangements must be made with the appropriate Airworthiness authority. If the agreement of Rolls-Royce Ltd., to individual repairs is desired, the Companies Service Representative or Service Department should be consulted. However, Rolls-Royce Ltd., Aero Division, requests that details of these repairs be provided for information purposes.

EPOXY MARKING ENAMEL - REPAIR

1. Application of Epoxy Marking Enamel

A. General.

- (1) This enamel is used to mark identification lettering in certain locations on the engine.
- (2) Ovens used for stoving shall be adequately ventilated. Waste gases from the heating system shall be excluded from the ovens. Paints based on different resin systems shall not be stoved in the same oven without authorization from the engine manufacturer.

B. Safety Precautions.

- (1) An efficient fume extraction system shall be used where these paints are sprayed. Brushing shall only be done in a well-ventilated area.
- (2) Some of these materials have flash points below 23 deg C and are highly flammable. Materials to which this applies are identified on the manufacturer's label.
- (3) All equipment used in the facility area shall be flame-proof.

C. Materials.

- (1) Refer to Table 401 for approved materials.

MATERIAL	REF.NO.	CODE NO.	SPECIFICATION
White Epoxy Enamel Base	SL.5459	9110-X-0000)	MSRR.9064 and DTD.5555

- (2) These materials are obtainable from: International Pinchin Johnson, Transport Division, Rotton Park Street, Ladywood, Birmingham 16, England.
- (3) The shelf life of these materials when stored in their original sealed containers is 12 months in temperate climates and six months in tropical climates.
- (4) Material exceeding this shelf life must be laboratory tested before use.

D. Preparation.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning) or locally degrease the area to be painted using a clean, lint-free cloth moistened with trichloroethane.

CAUTION: DO NOT HANDLE PREPARED SURFACES AFTER DEGREASING.

- (2) Ensure that there is a minimum time delay between degreasing and painting.
- (3) Mask off the component using a suitable stencil.

E. Application.

- (1) Prepare the enamel.
 - (a) Mix together equal volumes of base and catalyst.
 - (b) Add thinners, if necessary, up to 10 per cent of the volume and mix thoroughly.
 - (c) Allow the mixture to stand for 30 min before use.

NOTE: The pot life of the mixed material will be 8 h. Any material not used within this period shall be discarded.

MK.610-14-28
OVERHAUL

- (2) Apply one coat of the prepared enamel to the scheduled areas by brushing or spraying.
- (3) Allow to air dry at a minimum temperature of 16 deg C for 1 h minimum.
- (4) Apply a second coat of enamel if required.
- (5) Allow the final coat to air dry at a minimum temperature of 16 deg C for 4 h minimum, or stove the coating for 30 min at 125 ± 5 deg C, as specified in the relevant Repair Chapter.
- (6) Remove the stencil.

F. Inspection.

- (1) Visually inspect the coating to ensure that it is evenly applied and continuous, giving complete coverage to the scheduled areas.

ALOCROM 1200 - REPAIR

1. Application of Alocrom 1200

A. General.

- (1) Alocrom 1200 is used to repair damage to the anodic coating on aluminium alloy components.
- (2) This process shall only be used to repair damage in locations which can be effectively swilled, otherwise corrosion may result.
- (3) Alocrom 1200 complies with DTD.900/4413 and is obtainable from I.C.I. Ltd. (Paint Division), Wrexham Road, Slough, Buckinghamshire, England.

B. Safety Precautions.

- (1) Operators handling the materials shall wear respirators, eye shields, P.V.C. gloves, and aprons.
- (2) If the powder comes into contact with the skin it shall be washed off with liberal quantities of clean water.
- (3) Swabs and rags shall be thoroughly washed out in clean water immediately after use. Materials soaked in the solution constitute a fire hazard if allowed to dry out.

C. Process Solution.

- (1) This is an aqueous solution, containing:

Alcrom 1200 powder 5 oz/gal (Imp.)
 (31 g/l)

Nitric acid sp.gr. 1.42 0.5 fl oz/gal (Imp.)
 (3 ml/l)

The solution shall be made up by adding the powder and nitric acid to the water and stirring thoroughly until the powder is dissolved. A small amount of insoluble residue in the solution can be ignored.

- (2) The solution may be contained in a plastic container and is used at room temperature.
- (3) As this solution is used once only, solution control is not necessary.

D. Application.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning) or locally degrease the damaged area using a clean, lint-free cloth moistened with a group 2, 3, 4 or 5 solvent (Ref.72-09-00 - Cleaning).
- (2) Apply the solution to the damaged area using a cotton wool swab on the end of a stick.
- (3) Allow the solution to act on the surface of the component for 2-7 min, depending on the ambient temperature and the alloy being treated, until a light brown or golden iridescent film is produced.
- (4) Thoroughly wash off the solution using a plentiful supply of clean, cold running water then dry using a clean, dry air blast.
- (5) Apply approved de-watering oil as a temporary protective.

GOLD PAINT - REPAIR

1. Application of Gold Paint

A. General.

- (1) Engine components that are coated with gold paint are listed in Table 402 and areas to be painted are detailed in the referenced Figures.
- (2) This paint is used on certain engine hot-end components to provide a thermal barrier. It is effective only whilst in good condition. Oxidation, diffusion or contamination will reduce its effectiveness.
- (3) Ovens used for stoving shall be adequately ventilated. Waste gases from the heating system shall be excluded from the ovens. Paints based on different resin systems shall not be stoved in the same oven without authorization from the engine manufacturer.
- (4) An efficient fume extraction system shall be used where these paints are sprayed.

B. Material.

- (1) Refer to Table 401 for approved material.
- (2) The shelf life of this material when stored in the original sealed container is 12 months in temperate climates and six months in tropical climates.
- (3) Material exceeding this shelf life must be laboratory tested before use.
- (4) There is no requirement for a test piece.

NOTE: Liquid Bright Gold 6738 is discontinued product, existing stock may be used up. Refer para.1.B.

Gold Paint Material
Table 401

C. Preparation of Surfaces.

- (1) Examine the component and determine the area(s) to be gold painted.

NOTE: Gold paint is a high cost material. This should be considered when deciding the extent of application.

- (a) If a local application of gold paint is required carefully polish the appropriate area(s) with smooth grade emery cloth.
 - (i) If surface preparation by polishing is not practicable use masking tape to protect the paint surrounding the deficient area(s). Clean the area(s) to be painted by means of wet or dry abrasive blasting using the finest grade of grit available (Ref. 72-09-13 or 72-09-24 Repair).
 - (ii) Remove all masking tape.
 - (iii) Degrease the abraded area(s) using a clean lint free cloth moistened with a group 2 or 4 solvent (Ref.72-09-00 - Cleaning).

REPAIR

72-09-03Page 402
Jun 1/96

OLYMPUS 593

MK.610-14-28
OVERHAUL

(b) If the component is to be completely re-painted, carefully remove all traces of original gold paint.

(i) Clean the surface to be painted by means of wet or dry abrasive blasting using the finest grade of grit available (Ref. 72-09-13 or 72-09-24 Repair).

(ii) Vapour degrease the component (Ref.72-09-00 Cleaning).

CAUTION: DO NOT HANDLE COMPONENTS WITH BARE HANDS. GREASE DEPOSITS CAN HAVE ADVERSE EFFECT ON APPLICATION OF GOLD PAINT.

D. Application of Gold Paint.

WARNING: AVOID CONTACT BETWEEN GOLD PAINT AND BARE SKIN. PERSONAL SAFETY PRECAUTIONS MUST BE APPLIED. APPLY BARRIER CREAM TO HANDS, WEAR RUBBER OR PLASTIC GLOVES AND APRON. SAFETY SPECTACLES MUST ALSO BE WORN.

NOTE: The paint shall be used in the "as received" condition and may be applied by brushing or spraying. Brushing is recommended as spraying is not economical because of the high cost of the material.

NOTE: If brush application is used, the brush strokes for each coat should be confined to one direction. Each successive coat shall be brushed at 90 deg to the previous coat to ensure complete coverage.

(1) Apply one coat of paint and allow to air dry at room temperature for between 10 and 15 minutes.

(2) Stove the paint by heating the component to 150 ± 5 deg C for 30 minutes, or 300 ± 5 deg C for one hour.

REPAIR

72-09-03

Page 403
May 1/79

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (3) Remove the component from the oven and allow to cool.

CAUTION: DO NOT HANDLE COMPONENTS WITH BARE HANDS.
GREASE DEPOSITS CAN HAVE ADVERSE EFFECT ON
APPLICATION OF GOLD PAINT.

- (4) Apply and separately stove three further coats of paint observing the previously described procedure.
- (5) Finally stove the paint by heating the component to 250 ± 5 deg C for five hours, or 300 ± 5 deg C for one hour or 400 ± 5 deg C for 30 minutes.
- (6) Remove the component from the oven and allow to cool.
- (7) If necessary, wipe the painted surfaces using a clean, soft, lint-free cloth to remove dust contamination.

E. Inspection of Gold Painted Surfaces.

- (1) Inspect the component and ensure that the following requirements apply:
 - (a) Surfaces designated for gold paint are completely painted.
 - (b) The gold paint is continuous, adherent and metallic gold in appearance.
- (2) Reject the component for re-painting if painted surfaces show evidence of, cracking, flaking, loose adhesion or uneven surface finish. In some instances local application or touch-up with gold paint will be adequate to rectify deficient areas.

F. Local Touch-up with Gold Paint.

- (1) Prepare the surface (Ref.para.C.(1)(a)).
- (2) Apply gold paint (Ref.para.D.).
- (3) Inspect gold painted surfaces (Ref.para.E.).

HIGH HEAT RESISTING ALUMINIUM ENAMEL - REPAIR

1. Application of High Heat Resisting Aluminium Enamel

A. General.

- (1) Engine components that are protected by aluminium enamel are listed in Table 402 and the areas to be coated are detailed in the referenced Figures.
- (2) The enamel is used to prevent oxidation and corrosion at temperatures up to 550 deg C. It is resistant to engine lubricants, fuels and hydraulic fluids.
- (3) Ovens used for stoving shall be adequately ventilated. Waste gases from the heating system shall be excluded from the ovens. Paints based on different resin systems shall not be stoved in the same oven without authorization from the engine manufacturer.
- (4) An efficient fume extraction system shall be used where these paints are sprayed.

B. Materials.

- (1) Refer to Table 401 for approved materials.
- (2) The shelf life of these materials when stored in their original sealed containers is 12 months in temperate climates and six months in tropical climates.
- (3) Material exceeding this shelf life must be laboratory tested before use.

High Heat Resisting Aluminium Enamel Materials
Table 401

C. Test Piece Control.

- (1) The sequence of operations laid down in this procedure is aimed at producing a two coat enamel thickness of approximately 0.0015 in. (0,04 mm).
- (2) As a means of monitoring operators and maintaining the correct standard, a 12 x 12 in. (300 x 300 mm) piece shall be sprayed under the same conditions as the components during each working shift, to produce an average film thickness of not less than 0.001 in. (0,03 mm) and not more than 0.002 in. (0,05 mm).
- (3) The test piece shall be checked using an approved measuring instrument.

TN18134

OLYMPUS 593
MK.610-14-28
OVERHAUL

D. Preparation.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning).
- (2) Mask off the areas not to be enamelled using jigs, plates, plugs and/or masking tape.
- (3) Abrasive blast the areas to be enamelled to provide a clean keying surface (Ref.72-09-24 Repair).
- (4) On components that require a variation in enamel thickness, mask the areas which require only one coat.

NOTE: Apply enamel process immediately after abrasive blast as surface deterioration of components will occur if left for long periods without protection.

E. Application.

- (1) Stir the enamel thoroughly until no residual aluminium adheres to the stirrer.
- (2) Check the viscosity using a British Standard 1733 Flow Cup Type B.4. The viscosity shall be between 25 and 32 seconds quoted at 20 deg C. Thin if required using the recommended thinners.
- (3) Apply one wet coat of enamel to the component and allow to air dry at room temperature for three minutes.
- (4) Carefully remove the masking from any areas which require one coat only.
- (5) Apply a second wet coat of enamel and allow to air dry at room temperature for 30 minutes.

NOTE: The air drying time immediately before stoving is essential where static ovens are used. If conveyor type ovens having a gradual temperature increase are used, the air drying time is not essential.

SNECMA

- (6) Remove any masking tape prior to stoving.
- (7) Stove the enamel by heating the component to 190 ± 5 deg C and maintaining this temperature for two hours.
- (8) Remove the component from the oven and allow to cool.
- (9) Remove any remaining masking.

F. Inspection.

- (1) Inspect the coating for complete coverage of the scheduled areas and even application.
- (2) Ensure that there are no runs, drops, tears, blisters or other imperfections.
- (3) Measure the coating thickness using an approved measuring instrument. The average film thickness on two-coat areas shall be not less than 0.001 in. (0,03 mm) and not more than 0.002 in. (0,05 mm).

G. Local Touch-up.

- (1) Rub down the area immediately next to the damaged enamel and feather the edges using approved 240 or 320 grade abrasive paper, depending upon the roughness of the surface.
- (2) Degrease the prepared surface using a clean, lint-free cloth moistened with a group 2 or 4 solvent (Ref.72-09-00 - Cleaning). Ensure that the solvent has completely evaporated before proceeding.
- (3) Where possible the damage shall be touched up by spraying and stoving as detailed previously.
- (4) If stoving is not practicable, apply one uniform coat of Touch-up Enamel using a clean, good quality brush and allow to air dry at room temperature for one hour.

H. Applying Flash Coat.

NOTE: Flash coat is used to cover oil stains on aluminium enamelled engine run components prior to despatch.

CAUTION: DO NOT USE FLASH COAT FOR TOUCH-UP PURPOSES.

- (1) Thoroughly shake the aerosol before use.

PACK ALUMINIZING - REPAIR

1. Application of Pack Aluminizing

A. General.

- (1) Pack aluminizing is a means of depositing an aluminium rich coating onto nickel and cobalt based alloys for the purpose of resisting sulphur attack and oxidation.
- (2) A test piece or pieces of the same material, or a component of the same material and preferably same type, shall be processed with each batch of components so that the coating thickness may be determined.
- (3) If 'Beta' test equipment is to be used, the test piece shall be ground finished to within 0.001 in. (0,03 mm) of flatness. Test pieces shall be identified to the batches of components they represent.

B. Materials.

(1) Stripping solution.

- (a) The solution is made up as follows:

Nitric acid (S.G.1.42)	1 volume
Water	9 volumes
Sulphamic acid ($\text{NH}_2\text{SO}_3\text{H}$)	50 g/l

- (b) A minimum of 4 ml of new solution at an operating temperature of 45 ± 5 deg C must be used per square centimetre of aluminized coating to be stripped. Discard the solution after it has been used once.

(2) Etching solution.

- (a) This solution is made up as follows:

Ferric chloride (FeCl_3)	250 to 300 g/l
Hydrochloric acid	100 to 120 g/l

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (b) The solution must be contained in a plastic tank and operated at room temperature. During use, the solution must be agitated vigorously with compressed air, and a plastic lid assembled to the tank to prevent splashing.
- (c) The minimum immersion time is one minute, and the maximum time is five minutes.

(3) Stopping-off compound.

- (a) The following is a typical mix: the quantities may be varied proportionally as required.

Syton ZX or X30	2400 ml
Water	1400 ml
Iso-octyl alcohol	30 ml
Synperonic N	15 ml
Methyl cellulose (2 per cent w/v solution)	200 ml
Zircosil 200 mesh	18 kg

NOTE: The mixture shall be freshly prepared and kept constantly stirred, preferably mechanically, at a slow speed so that no appreciable rise in temperature occurs.

(4) Pack aluminizing powder.

- (a) The composition of the powder shall be as follows:

Aluminium powder (fine flake)	15 to 25 per cent by weight
Ammonium bromide (Labora- tory Reagent grade)	0.5 to 1 per cent by weight
Aluminium oxide (fused, 75 microns particle size)	Remainder

- (b) The ammonium bromide shall be crushed to a fine powder before mixing and then the constituents mixed mechanically and, preferably, sieved mechanically through a 60 BS mesh sieve.
- (c) After mixing, carry out the regeneration procedure as described in paragraph C.

TN16705

REPAIR

72-09-05

Page 402
Apr 1/80

OLYMPUS 593

MK.610-14-28
OVERHAUL

C. Regeneration of Aluminizing Powder.

- (1) Subject the powder to a 'dummy' aluminizing cycle.
- (2) Discard the top layer (12 to 25 mm) of used powder.
- (3) Mechanically crush the remaining used powder.
- (4) To the crushed used powder, add a quantity of mechanically mixed new powder of the following composition at the weight ratio of 90 per cent used powder: 10 per cent new powder.

Aluminium powder (fine flake)	20 to 25 per cent by weight
Ammonium bromide (Laboratory Reagent technical grade)	1.5 to 2 per cent by weight
Fused alumina - 200 mesh	Remainder

- (5) Crush the ammonium bromide to a fine powder before mixing and then mechanically mix the used and new powder and sieve as for new powder.
- (6) The aluminizing powder should be analysed for aluminium and ammonium bromide content at regular intervals.

D. Stripping Existing Coating.

- (1) Fill any cooling holes in the components with hard wax.
- (2) Mask non-aluminized surfaces with suitable masking tape.
- (3) Dry abrasive blast the aluminized surfaces using 120/220 mesh aluminium oxide abrasive grit.
- (4) Remove the masking tape.
- (5) Vapour degrease the components (Ref.72-09-00 Cleaning).
- (6) Stop-off all non-aluminized surfaces with approved wax or lacquer.
- (7) Immerse the components in the stripping solution for the minimum time necessary to strip the coating. The time should be within 1 to 4 hours.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (8) Rinse the components in cold water, flushing through any cooling holes, then pressure wash using an air/water gun.
- (9) Immerse the components in a one per cent ammonia neutralising solution for five minutes.
- (10) Remove wax.
 - (a) Immerse waxed components in boiling water to which has been added one per cent sodium carbonate.
 - (b) After de-waxing, swill the components in clean cold water, then dry them from an immersion in clean hot water at 80 deg C (minimum).
 - (c) If necessary, vapour degrease the components (Ref.72-09-00, Cleaning).
- (11) Fill any cooling holes with hard wax.
- (12) Re-mask the non-aluminized surfaces with suitable masking tape.
- (13) Dry abrasive blast the aluminized surfaces using 120/220 mesh aluminium oxide abrasive grit to remove aluminizing residues.
- (14) Remove the masking tape.
- (15) Remove the wax by immersion in boiling water to which has been added one per cent sodium carbonate.
- (16) Vapour degrease the components (Ref.72-09-00 Cleaning) and allow to cool to room temperature.
- (17) Mask non-aluminized surfaces with suitable masking tape.

CAUTION: KEEP TURBINE BLADE ROOT BLOCK AND ROOT PLATFORM FACES CLEAR OF ETCHING SOLUTION.
- (18) Immerse the components for two minutes in the etching solution to produce the required quality of etch to verify complete removal of the aluminizing.
- (19) Examine for the following indications:
 - (a) A slight grain etched appearance, which indicates complete and satisfactory removal of the coating.

REPAIR

72-09-05

Page 404

Apr 1/80

IN16708

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) A dark matt surface appearance which indicates the presence of residual coating.

(20) Wash off, preferably with an air/water gun, in clean, cold, running water.

(21) Dry off following immersion in hot water.

E. Stopping-off.

- (1) Vapour degrease the components (Ref.72-09-00 Cleaning).

CAUTION: AFTER DEGREASING DO NOT HANDLE OR OTHERWISE CONTAMINATE SURFACES TO BE ALUMINIZED.

- (2) Before applying masking, blank off cooling holes and internal passages with clear self-adhesive polyester tape or pre-formed caps of low density polythene film.

- (3) Where difficulties in removing stopping-off compound are likely to occur (e.g. re-entrant angles or cast surfaces) one of the following methods of applying stopping-off compound will ease its removal.

- (a) Prior to applying the first coat of stopping-off compound, apply clear polyester tape, low density polythene caps or approved lacquer to the component or,

- (b) Dilute the stopping-off compound with a calcined alumina/water mixture as required.

- (4) Apply stopping-off compound.

- (a) Two coats of the compound are to be applied. The first coat may be either the standard mix or the diluted version.

- (b) Apply the compound by dipping, brushing or spraying and while still wet, cover it with either 60/80 mesh alumina or 30/80 mesh molochite. Allow the first coat to dry for one hour (minimum) before applying the second coat.

- (c) Apply the second coat by dipping, brushing or spraying. Allow this coat to dry at room temperature for two hours (minimum).

- (5) Inspect the component and remove any stopping-off compound from areas that are to be aluminized.

OLYMPUS 593

MK.610-14-28

OVERHAUL

F. Aluminizing.

CAUTION: PROTECT ALL OTHER HEAT TREATMENT WORK FROM CONTAMINATION BY ALUMINIZING POWDER. CONTAMINATION COULD PROMOTE DANGEROUS METALLURGICAL EFFECTS.

- (1) Place a 1-2 in. deep layer of aluminizing powder at the bottom of the container.
 - (2) Lightly bed the components and test pieces into the powder, ensuring that the surfaces to be aluminized will be surrounded by a minimum of $\frac{1}{2}$ in. of powder when packed.
 - (3) Add more powder around the components.
 - (4) Settle the powder by gently tapping the bottom of the container on the bench, or by other similar means, to exclude as much air as possible.
 - (5) Add more powder to ensure that the surfaces to be aluminized are covered by 0.5 to 1 in. (12 to 25 mm) after settling as detailed previously.
 - (6) If more than one layer is to be packed into the container, repeat para.1.E.(1) to (5) for each layer.
- NOTE: When deciding the number of containers to be processed in the furnace, consideration must be given to the heat capacity of the furnace.
- (7) Place the loaded containers into a retort and seal the retort.
 - (8) Purge the retort by passing argon gas at the rate of 18 cu ft/h (0.5 cu m/h) until approximately five times the volume of the retort has been displaced.
 - (9) Place the purged retort in a pre-heated furnace. Maintain the argon flow to give a light positive pressure in the retort.
 - (10) Heat the components at the temperature and for the time specified in the relevant Repair chapter.
 - (11) Withdraw the retort from the furnace and allow to cool with the argon flow maintained until the pack temperature is low enough to enable the containers to be handled.

TN16078

REPAIR

72-09-05

Page 406

Apr 1/80

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (12) Remove the containers from the retort.
- (13) Discard the top layer of aluminizing powder from each container to a depth of 0.25 to 0.5 in. (6 to 12 mm).

CAUTION: HANDLE ALUMINIZED COMPONENTS CAREFULLY
TO AVOID DAMAGING ALUMINIZED SURFACES.

- (14) Carefully remove the components from the container.
- (15) Remove any powder adhering to the components using a bristle brush and/or a clean, dry air blast.
- (16) Carefully remove the stopping-off compound, tape and/or protective caps.
- (17) Wash the components in hot water and dry using a clean dry air blast.
- (18) Pack the aluminized components into a suitable transit container.
- (19) Submit the test pieces to the local controlling laboratory for coating thickness testing.

G. Quality Control of Coating Thickness.

- (1) Carry out control checks of coating thickness using 'Beta 750' particle back scatter equipment or metallographic measuring equipment.

NOTE: The diffusion zone shall not be included for measurement purposes. Refer to the relevant Repair Chapter for details of the coating thickness.

H. Post Aluminizing Heat Treatment.

- (1) Heat treat the components in an argon atmosphere for the length of time and temperature specified in the Repair Chapter.
- (2) After heat treatment maintain the argon flow and externally cool the retort by means of an air blast.
- (3) Pack the treated components into a suitable transit container.

REPAIR

Page 407

Apr 1/80

OLYMPUS 593

MK.610-14-28

OVERHAUL

2. Application of Pack Aluminizing Touch-Up (Sermaloy J)

A. General.

- (1) This process facilitates the local repair of pack aluminized coatings without the need for stripping of the original coating.
- (2) Engine components for which this repair has been approved, are listed in Table 401 and the surfaces to which it applies are indicated in the Figures referred to by the Table. There is no restriction to the size of any area to which this process may be applied.
- (3) Successful application of Sermaloy J depends to a great extent on the skill of the operator. It is therefore important that application techniques are perfected on test pieces prior to treating engine parts.

B. Safety Precautions.

- (1) Sermaloy J is highly toxic if ingested.
- (2) Respirators must be worn during spraying and the spraying area must be well ventilated with a minimum exhaust rate of 150 cubic feet per minute.
- (3) Avoid contact of Sermaloy J with the skin, eyes and mucous membranes. If contact does occur, the affected area must be irrigated immediately with running water. Medical attention must be obtained if contact is severe.

C. Preparation of Components.

- (1) Vapour degrease the component with trichlorethylene BS.580 (1963) Type 2 (Ref.72-09-00, Cleaning).
- (2) Dress the area to be treated with a 5 in. (127 mm) felt bob impregnated with 150 grade aluminium oxide (Aloxite powder).

TN27980

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Polish the area with a 3 in. (76 mm) diameter, Tampico treated, rotary fibre brush and Canning's Brushing Emery Compound No.797.
- (4) Subject the component to kerosine wash (Ref.72-09-00, Cleaning) then repeat the vapour degrease operation.
- (5) Swab etch the dressed surface for 10 seconds in solution E (Ref. 72-09-14, Repair).

NOTE: The swab etching operation will establish whether the surface is suitable for repair with Sermaloy J. A satisfactory surface is indicated by a faint grain etch; an unsatisfactory surface will show black or dark grey deposits.

- (6) Thoroughly wash the component with cold water and air/water blast.
- (7) Immerse the component in clean hot water then dry it with a blast of clean dry air.
- (8) Inspect the component by the fluorescent penetrant method (Ref.72-09-00, Inspection/Check).
- (9) Subject the component to kerosine wash followed by vapour degrease (Ref.72-09-00, Cleaning).
- (10) Apply paper masking tape to the areas not requiring repair and keep the paper approximately 0,050 in. (1,3 mm) away from the edge of the dressed surface.

CAUTION: WEAR CLEAN COTTON OR POLYTHENE GLOVES
WHEN CARRYING OUT ALL SUBSEQUENT OPERATIONS.
STRICT CLEANLINESS IS ESSENTIAL.

- (11) Swab degrease the area to be repaired (Ref.72-09-00, Cleaning).
- (12) Dry abrasive blast the areas to be repaired (Ref.72-09-24, Repair).
- (13) Apply a clean dry air blast to the component, then remove the masking tape.
- (14) Remove masking tape residual deposits by swab degreasing (Ref.72-09-00, Cleaning).

REPAIR

72-09-05

Page 409

Sep 1/80

OLYMPUS 593
MK.610-14-28
OVERHAUL

D. Repair Procedure.

(1) Determine the weight of Sermaloy J to be applied.

(a) Measure the area of the surface to be repaired.

(b) From the following formula, establish the weight of Sermaloy J per sq.cm. to be applied to obtain the required coating thickness of between 0.0015 and 0.003 in.

$$\frac{\text{Thickness of coating required (inches)} \times 25}{0.0025} = \text{mg/sq.cm.}$$

e.g. Coating thickness required, 0.0015 in.

$$\frac{0.0015 \times 25}{0.0025} = 15 \text{ mg/sq.cm.}$$

(c) Multiply the total surface area to be repaired (Ref. para. (a)) by the weight per sq.cm. established in para. (b) to determine the weight of Sermaloy J to be applied to effect the repair.

(2) Weigh the component and record its weight. Strict accuracy is necessary for this operation.

(3) If Sermaloy J is to be applied by spraying (Ref. para. (4)) apply paper masking tape to the areas not requiring repair and keep the paper approximately 0.050 in. (1,3 mm) away from the edge of the dressed surface.

(4) On large repair areas, apply Sermaloy J by spraying.

WARNING: SAFETY PRECAUTIONS MUST BE STRICTLY OBSERVED.

(a) Use spraying equipment typified by a Binks Bullows L900 spray gun with a B940 jet.

(b) Operate at 35 p.s.i. with the spray gun adjusted to emit a fine spray and, with the nozzle held approximately 2 to 3 in. (50 to 75 mm) from the repair surface, spray by a series of short passes.

TN31444

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (5) On small repair areas, apply Sermaloy J with a small camel hair or squirrel hair brush.
- (6) Allow the first coat to air dry until it has a matt grey appearance, then apply a second coat and allow it to air dry.

NOTE: Normally two coats are adequate but experience with the technique may indicate that more, or less is necessary.

- (7) Remove the masking tape from the component.
- (8) Place the component in an electric oven for 15 minutes (minimum) and maintain the temperature at 80 deg C, plus or minus 10 deg C (158 to 194 deg F).
- (9) Visually inspect the repair for crazing (checking), cracking or other defects. If any defect is present, remove the coating by rinsing in cold water, then thoroughly dry it at low oven temperature and repeat the procedures of paragraphs D.(1) to (8).
- (10) After successful application of Sermaloy J, place the component in an air circulating oven for 15 minutes (minimum) and maintain the temperature at 330 deg C, plus or minus 10 deg C (608 to 644 deg F).
- (11) Visually inspect the repair for crazing (checking), cracking or other defects. If defects are present at this stage, mask the untreated areas and remove the defective coating by dry abrasive blasting (Ref.72-09-24, Repair) and repeat the process from paragraph C.(13) onwards.

OLYMPUS 593

MK.610-14-28

OVERHAUL

(12) Coating thickness check.

- (a) Establish the weight of Sermaloy J applied.
 - (i) Weigh the component and record its weight.
 - (ii) From the weight recorded, subtract the previously recorded weight of the component (Ref. para.D.(2)).
- (b) Calculate the thickness of the new coating from the following formula:

$$\frac{\text{Weight of Sermaloy J applied (mg)}}{\text{area covered (sq.cm.)}} \times 0.0001 = \text{coating thickness (inches)}$$

e.g. Weight of Sermaloy J applied ... 60 mg
Area covered... ... 4 sq.cm.

$$\frac{60}{4} \times 0.0001 = 0.0015 \text{ in.}$$

- (c) If test pieces have been coated, measure the coating thickness on the test pieces to supplement the weight checks.
- (13) Diffusion heat treat the component.
- (a) Place the component on a metallic tray and ensure that the coated surfaces are not in contact with the tray or retort.
 - (b) Diffusion heat treat the component (Ref. Table 401).

Aug 1/79

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (14) Remove the resulting residues from the coated surface with a Bessmer iron rotary soft wire brush or an approved alternative.

NOTE: The brush wires should not exceed 0.003 in. (0,076 mm) in diameter and the brush speed should not exceed 1,500 r.p.m. (2000 ft.per min.).

- (15) Visually inspect the coated surface to ensure that it has a uniform appearance and is free from chipping or oxidation (green scaled appearance).

ABRADABLE COMPOSITE COATINGS - REPAIR

1. Application of Abradable Composite Coatings by Combustion Spraying

A. General.

- (1) This para. details the requirements for the application of composite powder and wire materials to produce abradable seal linings.
- (2) Use this repair method only when specifically referenced in a repair procedure. Deposition parameters for various materials are tabulated at the end of this Chapter. Additional parameters applicable to the component concerned will be detailed in the relevant Repair Chapter.
- (3) Components to which abradable coatings are applied must be dimensionally correct, the coating is not intended to compensate for dimensional inaccuracies.
- (4) Whenever possible, the application of sprayed coatings should be after the completion of all other processing and machining.

B. Safety Precautions.

- (1) Combustion spray equipment emits glare and has a high noise level, it should, therefore, be sited where personnel other than those operating the equipment are not affected. Sound-proofing and screening may be necessary to facilitate this.
- (2) Operators must wear a welders helmet, safety glasses, ear defenders, high necked dark overalls and gloves. Additional safety glasses and ear defenders must be available for use by other personnel in the spraying area.

PRINTED IN ENGLAND

- (3) A fume extraction system must be provided and be in operation before the gun is lit.

WARNING: CERTAIN MATERIALS AND GASES USED DURING THE PROCESS ARE EXPLOSIVE. ENSURE HOSES AND FITTINGS ARE SERVICEABLE. DO NOT ALLOW HOSES TO TRAIL ON FLOOR.

C. Process Control.

- (1) The process is monitored by means of an indentation test using a Rockwell Superficial Hardness Tester, 15Y Scale. Hardness value limits for each type of coating are specified in the deposition parameters.
- (2) The hardness test is carried out on the component, providing the component geometry is suitable and the coating is of the required thickness for testing, if this is not possible then a test piece must be attached to the component.

D. Powder Control.

- (1) Powder must be kept in closed containers to prevent contamination by foreign matter.
- (2) Where humidity and/or temperature variations are extreme, special storage facilities will be necessary to keep the powder in a dry, free flowing condition.

CAUTION: DO NOT EXCESSIVELY MIX COMPOSITE POWDERS. DETERIORATION MAY RESULT.

- (3) Thoroughly mix powder (and sieve if necessary) immediately before use and before repacking.
- (4) The powder feed system must be cleaned out whenever powders are changed and at the end of every shift; cleanliness and freedom from moisture are essential.
- (5) Regular inspections must be made of the powder feed system and rectification carried out as necessary.

E. Test Piece.

- (1) Each test piece must be flat and of the following minimum dimensions 1 in. x $\frac{1}{4}$ in. x 16 s.w.g. (25 x 15 x 1.6 mm).
- (2) The test piece must be attached to the component, adjacent to the area being sprayed and sprayed simultaneously to a thickness suitable for the hardness test.
- (3) It is important that the test piece is suitably marked and can be identified with the component it represents.

F. Preparation.

- (1) Machine off the old coating, pay particular attention to the dimensions quoted in the Repair Chapter.
- (2) Vapour degrease the component (Ref. 72-09-00, Cleaning) or locally degrease using a clean, lint-free cloth moistened with trichloroethane.
- (3) Mask off the areas which are not to be vapour blasted either with a suitable tape or mechanical mask.

NOTE: Time delay between blasting and spraying must not exceed two hours, during which the component must be kept in a dry clean condition.

- (4) Vapour blast (Ref. 72-09-13 Repair, Vapour Blasting) to provide a clean keying surface for the coating.
- (5) Should it be necessary to remove the masking before spraying, extreme care must be taken to avoid contaminating the areas to be sprayed, if contamination does occur, repeat the preparation procedure.

G. Pre-heating.

- (1) Certain components must be pre-heated to a specified temperature before spraying, the temperature will be specified in the relevant Repair Chapter.

REPAIR

72-09-06

Page 403
Feb 1/78

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Small components may be pre-heated by the spray gun with the powder supply cut off.
- (3) Large or high density components will require pre-heating in an oven.

H. Bond Coat.

- (1) Ensure the areas that are not to be sprayed are masked off.
- (2) Immediately before spraying of the top coat apply a bond coat between 0.003-0.005 in. (0.08-0.13 mm) in thickness. Apply the bond coat specified in the relevant Repair Chapter. Should the bond coat be accompanied by the appearance of 'smoke' or 'bloom' this effect must be removed using a dry, clean air blast before spraying is continued.

J. Spraying.

- (1) Facilities should be available for the component to be rotated if necessary. Ideally both the component and the gun should be capable of being mechanically driven and controlled relative to one another during spraying.
- (2) Arrange a dry cooling air flow over the component, but not to impede the flow of the sprayed material, to ensure the temperature of the deposit and component does not exceed 170 deg C.
- (3) Angle the gun so that the direction of spray is as near as possible 90 deg to the receiving surface and never less than 50 deg.
- (4) To limit the occurrence of layering, spraying must be continuous with only the necessary pause for cooling or measurement checks.

FN20657

REPAIR

72-09-06

Page 404
Oct 1/76

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (5) To ensure repeatability, spray parameters must be critically controlled and recorded.
- (6) After each component has been sprayed, the spray nozzle, powder and gas ports must be cleaned.
- (7) On completion of spraying remove all masking from the component taking great care not to damage the coating.

K. Inspection After Spraying.

- (1) Inspect the coating to ensure that there is no evidence of blistering, cracking or chipping, for uniformity of deposit and that the deposit is dimensionally correct. Faulty coatings must be completely removed by machining prior to complete reprocessing.

L. Rockwell Indentation Test.

- (1) The performance and accuracy of the equipment must be continually monitored against the standard Rockwell test block.
- (2) Set up the Rockwell tester with an indenter of 0.500 in. (12,7 mm) diameter and a major load of 33 lb (15 kg). Adjust the dashpot, for controlling the major load, to apply the load over a period of 24-25 seconds.
- (3) Prepare the surface of the coating by dressing with dry emery cloth, e.g. 120-220 grade, until smooth, take care not to smear the surface. Remove residual dust with a dry, clean air blast.
- (4) Hold the component rigid on the tester with the coated surface normal to the axis of the indenter.
- (5) Apply the minor load gradually and set the scale, with the pointer, to read zero.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (6) Within 10 seconds apply the major load by tripping the operating lever.
- (7) Remove the major load after 30 seconds + 1 second and read off the indentation value to the nearest full division.

NOTE: Disregard the first two readings after fitting the indenter, the indenter only seats correctly under load.

- (8) Where the hardness test is carried out on the component, indentation values must be taken at a minimum of six positions around the component, approx. 60 deg intervals, and the average recorded.
- (9) Where the hardness test is carried out on a test piece, record the average indentation values measured at three positions.

M. Finishing.

- (1) The coating must be machined by turning, with a single point tipped tool, without coolant. Adequate facilities for the extraction of dust residues must be provided.

N. Inspection after Finishing.

- (1) Inspect the coating to ensure there is no lifting, smearing, pitting or chipping of the deposit, or entrapment of debris.
- (2) Ensure the coating is dimensionally correct, faulty deposits must be completely removed, by machining, prior to complete reprocessing.

CHROMIUM PLATING - REPAIR

1. Application of Chromium Plating

A. General.

- (1) Chromium plating is applied as a wear resistant and anti-fretting coating to steel and heat-resistant alloy components. It may also be used to salvage components which are dimensionally incorrect through wear, etc.
- (2) Alternative solutions to those specified within this process may be used providing they are approved by the engine manufacturer.
- (3) Components to be plated are specified in the appropriate Repair Chapters. Also specified are plating areas and thicknesses, and any necessary pre-plating stress relief and post-plating de-embrittlement heat treatments.

B. Safety Precautions.

- (1) Chromic acid spray is injurious if inhaled, causing ulcers in the nose and possibly causing perforation of the nasal septum. Chromic acid salts and solutions in contact with the skin may cause sores, and ulcers may be formed if chromic acid gets into cuts and abrasions.
- (2) This process is subject to the Chromium Plating Regulations 1931 in Great Britain, and similar regulations in other countries. It is the duty of the employer to arrange for a responsible person to inspect the hands and forearms of all persons employed in the application of chromium plating twice a week and to be examined by a doctor every 14 days.
- (3) The chromium plating bath must never be used unless the fume extraction system is in operation and is fully serviceable.

PRINTED IN ENGLAND

TN31587

OVERHAUL

- (4) Recommended barrier cream shall be applied to the hands and forearms before starting work, and personnel shall wear the protective clothing provided.
- (5) Smoking and the consumption of food and drink in the facility area are prohibited.
- (6) Cuts and abrasions which appear to be not healing readily shall be reported without delay to the Medical Department.
- (7) Materials such as rags and sawdust which have absorbed chromic acid solution constitute a fire risk. Such materials shall be removed to a safe place for burning.

C. Process Solutions.

(1) Stripping solution 'A'.

- (a) This is an aqueous solution of 50 per cent by volume hydrochloric acid (HCl) sp.gr. 1.18, containing a suitable inhibitor such as Armohib 25.
- (b) The solution may be contained in a plastic tank incorporating a fume extraction system and shall be operated at room temperature. Components shall be immersed in the solution until stripping is complete.
- (c) Solution control shall be by discarding the solution when no longer effective.

(2) Stripping solution 'B'.

- (a) This is an aqueous solution of 10 per cent by weight sodium hydroxide (NaOH).
- (b) The solution may be contained in a mild steel tank incorporating a fume extraction system and shall be operated electrolytically at room temperature. The tank shall form one electrode and the components the other. Direct current shall be applied at 6-8 V and the components shall be treated anodically at 20-50A/sq.ft (2-6A/sq.dm) until the deposit is stripped.

- (c) Solution control shall be by discarding the solution when no longer effective.
- (3) Stripping solution 'C'.
- (a) This is an aqueous solution of Enthone Enstrip CR.5 at a strength of 16 oz/gal (Imp.) (100 g/l).
- (b) The solution may be contained in a stainless steel tank incorporating a fume extraction system and shall be operated at 70-80 deg C. The components shall be immersed in the solution until stripping is complete.
- (c) Solution control shall be in accordance with the manufacturer's instructions.
- (4) Electrolytic alkaline cleaning solution.
- (a) This is an aqueous solution, containing:
- | | |
|-----------------------|---------------------|
| Sodium hydroxide | |
| (NaOH)... | 13-16 oz/gal (Imp.) |
| | (80-100 g/l) |
| Sodium cyanide (NaCN) | 1.2-1.6 oz/gal |
| | (Imp.) (8-10 g/l) |
- (b) The solution may be contained in a mild steel tank and shall be operated at room temperature, with the tank forming one electrode and the components forming the other electrode. Direct current shall be applied at 6-8 V and a reversing polarity unit shall be installed. Components shall be cleaned by cycling the current for 20 s cathodically and 10 s anodically, finishing anodically, for a sufficient period of time to produce a clean surface. This is usually effected in 2 min.
- (c) Solution control shall be by regular analysis and making suitable additions.

(5) Etching solution 'A'.

- (a) This is an aqueous solution, containing:

Sulphuric acid				
(H ₂ SO ₄)	141-144 oz/gal (Imp.) (880-900 g/l)

This can be obtained as sulphuric acid sp. gr. 1.496. An alternative solution is an aqueous solution containing:

Sulphuric acid				
(H ₂ SO ₄)	83-87 oz/gal (Imp.) (520-540 g/l)

The solution may be made up by adding three parts by volume sulphuric acid (sp. gr. 1.84) to seven parts by volume water with care and constant stirring, then allowing the solution to cool to room temperature and making up any evaporation loss by adding the appropriate quantity of water.

- (b) Either solution may be contained in a lead-lined tank, fitted, if necessary, with cooling coils to maintain the solution temperature between 12 and 24 deg C. The sides of the tank may form one electrode and the components the other electrode. Direct current shall be applied at 6-8 V, and a polarity reversing unit shall be fitted. Stainless steel components shall be etched anodically for 30-60 s, or anodically for 45 s followed by 15 s cathodically. Low alloy steels shall be etched anodically for 30-60 s.
- (c) Solution control shall be by regular analysis and making suitable additions.

(6) Etching solution 'B'.

- (a) This is an aqueous solution, containing:

Ferric chloride ($\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$)	40-53 oz/gal (Imp.) (250-330 g/l)
--	-----	-----	--------------------------------------

Hydrochloric acid (HCl)	24-27 oz/gal (Imp.) (150-170 g/l)
----------------------------	-----	-----	--------------------------------------

One litre of the solution may be made up by adding 170 ml hydrochloric acid (sp. gr. 1.16) to 400 ml of water, then dissolving 330 g ferric chloride in the solution and making up to one litre with water.

- (b) The solution may be contained in a plastic tank and is used at room temperature. Components shall be immersed in the solution for $1\frac{1}{2}$ -2 min.
- (c) The solution must be regularly analysed by a laboratory and discarded on their instructions.

(7) Chromium plating solution.

- (a) This is an aqueous solution, containing:

Chromium trioxide (CrO_3)	40-48 oz/gal (Imp.) (250-300 g/l)
---	-----	-----	--------------------------------------

Sulphuric acid (H_2SO_4)	0.40-0.48 oz/gal (Imp.) (2.5-3.0 g/l)

- (b) The solution may be contained in a lead-lined, mild steel tank and is operated at 52 ± 2 deg. C. Antimony/lead or tin/lead alloy anodes shall be used and the ratio of anode area to cathode area shall be not less than 1:4. Plating shall be carried out at 300-400 A/sq.ft (32-43 A/sq.dm) cathodic current density.
- (c) Solution control shall be by regular analysis and making suitable additions. The chromic acid and sulphuric acid contents shall be maintained within the limits specified previously and within the ratio of 90-110:1. The trivalent chromium content plus the iron content of the solution shall not exceed 1.6 oz/gal (Imp.) (10 g/l).

NOTE: Self-regulating, high speed chromium plating solutions are available principally as proprietary compounds. These shall be prepared and operated according to the manufacturers instructions.

D. Stripping Existing Plating.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning).
- (2) Immerse the component into the appropriate stripping solution. For low alloy steel components use Stripping Solution 'A' or 'B'; for stainless steel and heat-resistant alloy components use Stripping Solution 'A' or 'C'.

NOTE: If component geometry permits, the chromium plating may be removed by grinding as an alternative to chemical stripping.

- (3) Rinse in clean, cold running water and dry using a clean, dry air blast.

TN42258

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (4) Unless the component is to be re-plated immediately, apply approved de-watering oil as a temporary protective.

E. Preparation.

- (1) Stress relieve the component if required as specified in the appropriate Repair chapter.
- (2) Mount the component in a jig.
- (3) Vapour degrease the component (Ref.72-09-00 Cleaning) or locally degrease the area to be plated using a clean, lint-free cloth moistened with trichloroethane.
- (4) Mask off areas not to be plated using a suitable masking medium.
- (5) Clean the component by immersion in the Electrolytic Alkaline Cleaning Solution or by scouring the area to be plated with wet pumice powder.
- (6) Wash the component in clean, cold running water.

NOTE: Components which were cleaned with wet pumice powder do not require etching.

- (7) Etch the component. For steel components use Etching Solution 'A'; for heat-resistant alloy components use Etching Solution 'B'.

NOTE: Austenitic stainless steels may be etched in either solution.

NOTE: Steel components may also be etched anodically for 20-30 s at 6 V in a chromium plating solution, but this, preferably, should not be the bath which is to be used for the plating.

- (8) Unless the component was etched in a chromium plating solution, wash the component in clean, cold running water.

**OLYMPUS 593**

MK.610-14-28

SNECMA

OVERHAUL

F. Plating.

- (1) Immediately after etching transfer the component to the chromium plating bath. Allow the component to attain the solution temperature before applying the current. Plate until the required thickness of deposit is achieved.
- (2) Wash the component in a drag-out tank and then in clean, cold running water.
- (3) Dry off from immersion in clean hot water.
- (4) Remove all traces of masking and ensure that the component is in a clean condition.
- (5) Subject the component to de-embrittlement if required as specified in the appropriate Repair Chapter. Carry out the de-embrittlement as soon as possible, and not later than 16 h after plating.
- (6) Apply approved de-watering oil as a temporary protective.

NOTE: The temporary protection may be deferred until after inspection if the latter is carried out within 8 h of de-embrittlement.

G. Inspection After Plating.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning).
- (2) Visually inspect the component to ensure that the plating is free from blisters, excessive roughness, deep pitting and coarse cracking.
- (3) Check the plating thickness using appropriate approved methods.
- (4) Carry out a crack detection test if required as specified in the relevant Repair Chapter.

NOTE: When using penetrant methods of crack detection, the natural crack network of the chromium deposit shall be ignored.

REPAIR

MK.610-14-28
OVERHAUL

H. Finishing.

- (1) Grind the deposit if required to the dimensions specified in the appropriate Repair Chapter.
- (2) Visually re-inspect the deposit after grinding to ensure adhesion and freedom from excessive cracking.

NOTE: Even correct grinding renders the natural network of fine cracks more visible.

- (3) Apply approval de-watering oil as a temporary protective.

SILVER PLATING - REPAIR

1. Application of Silver Plating

A. General.

- (1) Silver plating is applied as an anti-seizure and anti-fretting coating to steel and nickel alloy components.
- (2) Alternative solutions to those specified within this process may be used providing they are approved by the engine manufacturer.
- (3) Components which have a silver plated finish are listed, together with details of stripping, etching and cleaning requirements, in Table 401. Surfaces which are to be silver plated are shown in the illustrations referred to in the Table.

B. Safety Precautions.

- (1) Cyanide salts, solutions and hydrocyanic gas are deadly and extremely rapid poisons. Hydrocyanic gas is formed when cyanide comes into contact with acid, therefore it is imperative that cyanide and acids are kept apart.
- (2) Poisoning can result from swallowing cyanide, absorption through the skin and/or breathing hydrocyanic gas. Symptoms of poisoning are one or more of the following:
 - (a) Dizziness, nausea, general weakness and headache.
 - (b) Palpitations.
 - (c) Feeling of suffocation and tightness in the throat.
 - (d) Pallor, deep breathing and unconsciousness.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Operators and other personnel in the facility area shall wear the protective clothing provided. Finger-nails shall be kept short.
- (4) Personnel shall wash thoroughly before eating, drinking or smoking. Food and drink shall not be consumed in the facility area, neither shall eating or drinking utensils be brought into the area.
- (5) Cyanide shall be stored in a secure area and shall be accessible only to authorized personnel.
- (6) Cyanide antidote shall be provided and be readily available in the facility area.

C. Process Solutions.

(1) Stripping solution 'A'.

- (a) This is an aqueous solution, containing:

*m-nitrobenzenesulphonic
acid sodium salt
(NO₂C₆H₄SO₃Na) ... 55-65 g/l

Sodium cyanide
(NaCN) ... 90-180 g/l

*NOTE: A similar proprietary compound is
Enthone Enstrip S or Alkan Alkastrip NS.

- (b) The solution may be contained in a stainless steel tank and may be used at room temperature or, for more rapid stripping, at temperatures up to 70 deg C.

- (c) Solution control shall be by regular analysis and making suitable additions.

(2) Stripping solution 'B'.

- (a) This is an aqueous solution, containing:

Hydrochloric acid
(HCl) ... 54-62 g/l

One litre of the solution may be made up by adding 170 ml hydrochloric acid (sp. gr. 1.16) to 400 ml of water, then dissolving 330 g ferric chloride in the solution and making up to one litre with water.

- (b) The solution may be contained in a plastic tank and is used at room temperature. Components shall be immersed in the solution for up to 2 min.

OVERHAUL

- (c) The solution must be regularly analysed by a laboratory and discarded on their instructions.
- (8) Nickel strike solutions.
- (a) This is an aqueous solution, containing:
- Nickel chloride
($\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$) ... 300-400 g/l
- Hydrochloric acid
(sp. gr. 1.16) ... 25-40 g/l
- (b) The solution may be contained in rubber lined or plastic tanks and is used at room temperature. Components shall be cathodically treated for 1-2 min at 300-500 A/sq m.
- (c) Solution control shall be by regular analysis and making suitable additions.
- (9) Silver strike solution.
- (a) This is an aqueous solution, containing:
- Silver cyanide
(AgCN)... 2-4 g/l
- Potassium cyanide (KCN) ... 20-60 g/l
- The solution shall be made up by dissolving the potassium cyanide in a small quantity of water, then dissolving the silver cyanide in the solution and finally adding water to give the correct volume.
- (b) The solution may be contained in a polythene tank and is used at room temperature. The tank shall be supplied with a source of direct current at 6-8 V. Anodes shall be silver or mild steel, depending upon the silver content of the solution. Striking shall be carried out at 215-270 A/sq m, for up to 2 min. It is essential that the working voltage is supplied before components are immersed in the solution.

IN32519

MK.610-14-28
OVERHAUL

- (c) Solution control shall be by regular analysis and making suitable additions.

(10) Silver plating solution.

- (a) This is an aqueous solution, containing:

Silver cyanide (AgCN) ... 50 g/l

Potassium cyanide (KCN) ... 86 g/l

Ammonium thiosulphate
($(\text{NH}_4)_2\text{S}_2\text{O}_3$) ... 1 g/l

The solution shall be made up by first dissolving the potassium cyanide in a small quantity of water, then dissolving the silver cyanide in the solution. The ammonium thiosulphate shall be dissolved separately in water and then added to the solution whilst stirring. Finally, water shall be added to make up to the correct volume.

- (b) The solution may be contained in a plastic tank and shall be provided with continuous filtration. The tank shall be supplied with a source of direct current at 6-8 V. Pure silver anodes shall be used. The bath shall be operated at 50 to 110 A/sq m for vat plating and maintained at 20-30 deg C. It is essential that the working voltage is applied before components are immersed in the solution. A daily addition of 0.1 g/l of ammonium thiosulphate shall be made before plating begins. The addition shall be dissolved in a small quantity of water before being added to the vat.

- (c) Solution control shall be by regular analysis and maintaining the silver cyanide content at 45-50 g/l and the free potassium cyanide content at 46-53 g/l.

D. Stripping Existing Plating.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning).

OLYMPUS 593

MK.610-14-28

shecma

OVERHAUL

- (2) Immerse the component in the appropriate stripping solution (Ref. Table 401).
- (3) Rinse in clean, cold running water and dry using a clean, dry air blast.
- (4) Stress relieve heat treat, if required, for 1 hour at $200^{\circ}\text{C} \pm 10^{\circ}\text{C}$ (Ref. Table 404).

NOTE: Heat treatment time commences when the component has reached the required temperature.

- (5) If specified in Inspection/Check, carry out crack detection procedures on the component before continuing with the plating procedure.
- (6) Unless the component is to be re-plated immediately, apply approved de-watering oil as a temporary protective.

E. Plating Procedure.

- (1) Mount the component in a jig or suspend from copper wire.
- (2) Vapour degrease the component in Triklone 'N' (Ref. 72-09-00 Cleaning).
- (3) Mask off areas not to be plated using I.C.I. Stopping-off Red Lacquer F230-2006.
- (4) Clean in the appropriate cleaning solution (Ref. Table 401).
- (5) Wash in clean, cold running water.
- (6) Etch the component in the appropriate etching solution (Ref. Table 401).
- (7) Wash in clean, cold running water.
- (8) Immerse in nickel strike solution (Ref. para.C.(8)).
- (9) Wash in clean, cold running water, then transfer direct to silver strike solution.
- (10) Immerse in silver strike solution (Ref. para.C.(9)), then transfer direct to silver plating solution (Ref. para.C.(10)).

OVERHAUL

- (11) Remove the component from the silver plating solution when a deposit of 0.0002 in. (0,005 mm) minimum is obtained, unless otherwise specified.
- (12) Wash in clean, cold running water and dry off from immersion in clean boiling water.
- (13) Remove all traces of masking and ensure that the component is in a clean condition.
- (14) Subject the component to de-embrittlement heat treatment, if required (Ref.Table 404), as specified in para.(a). Carry out the de-embrittlement heat treatment as soon as possible, and not later than 16 hours after plating.
 - (a) De-embrittlement heat treat at 250 ± 10 deg C. for two and a half hours.

NOTE : Heat treatment time commences when the component has reached the required temperature.

- (15) If, as a result of de-embrittlement, there is oxide discolouration sufficient to interfere with subsequent inspection, remove the discolouration using a non-electrolytic cleaning solution (Ref. para.C.(4)).
- (16) Apply approved de-watering oil as a temporary protective.

NOTE : The temporary protection may be deferred until after inspection if the latter is carried out within 8 hours of de-embrittlement.

F. Inspection.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning).
- (2) Visually inspect the component to ensure that the plating is smooth, adherent and free from burns and blisters.
- (3) If instructed carry out plating thickness checks using approved equipment.
- (4) Apply approved de-watering oil as a temporary protective.

NICKEL PLATING - REPAIR

1. Application of Nickel Plating

A. General.

- (1) Nickel plating is applied as a wear resistant and anti-fretting coating to steel and may also be used to salvage components which are dimensionally incorrect through wear etc.
- (2) Alternative solutions to those specified within this process may be used providing they are approved by the engine manufacturer.
- (3) Components to be plated are specified in the appropriate Repair Chapters. Also specified are plating areas and thicknesses, and any necessary pre-plating stress relief and post-plating de-embrittlement heat treatments.

B. Safety Precautions.

- (1) Cyanide salts, solutions and hydrocyanic gas are deadly and extremely rapid poisons, hydrocyanic gas is formed when cyanide comes into contact with acids therefore these should be kept apart. Poisoning may result from:
 - (a) Swallowing cyanide.
 - (b) Breathing hydrocyanic gas.
 - (c) Absorption through the skin.
 - (d) Warning signs of poisoning are, dizziness, nausea, headache, palpitations, feeling weak, suffocation, tightness of the throat, pallor, deep breathing and unconsciousness.

WARNING: AT ALL TIMES CYANIDE ANTIDOTE MUST BE READILY AVAILABLE. ALL PERSONS WORKING IN THE VICINITY MUST BE THOROUGHLY CONVERSANT WITH THE USE OF THE ANTIDOTE AND FIRST AID PROCEDURES.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Operators must wear the protective clothing provided.
- (3) Recommended barrier cream shall be applied to the hands and forearms before starting work. Finger nails should be kept short and thorough washing performed before eating, drinking and smoking.
- (4) Smoking and the consumption of food and drink in the facility area are prohibited.
- (5) Cuts and abrasions which appear not to be healing readily must be reported without delay to the Medical Department.
- (6) Materials such as rags and sawdust which have absorbed the solutions must be placed in a container for disposal.
- (7) Cyanide should be stored in a place where it is accessible only to authorised persons.

C. Process Solutions.

- (1) Stripping solution 'A'.
 - (a) This is an aqueous solution of 141-148 oz/gal (880-920 g/l) of Sulphuric Acid (H_2SO_4). This can be obtained as sulphuric acid SG 1.496.
 - (b) The solution may be contained in a lead-lined tank and used at room temperature. The tank shall form one electrode and the component the other. Direct current shall be applied at 2-6V until the deposit is removed.
 - (c) Analyse the solution regularly and maintain proportions by addition.

IN8585

OLYMPUS 593

MK. 610-14-28

OVERHAUL

(2) Stripping solution 'B'.

(a) This is an aqueous solution containing:

Sodium cyanide (Na CN)	14.4-28.8 oz/gal (90-180 g/l)
Nitrobenzenesulphuric Acid Sodium Salt ($\text{NO}_2\text{C}_6\text{H}_4\text{SO}_3\text{Na}$)	8.8-10.4 oz/gal (55-65 g/l)

A similar proprietary compound to the above salt is Enthone "Enstrip S" or Alkan AlkaStrip NS.

(b) The solution may be contained in a mild steel tank and may be used cold or for more rapid stripping at temperatures up to 70 deg C.

(c) Analyse the solution regularly and maintain proportions by addition.

(3) Hot alkaline cleaner.

(a) This is an aqueous solution containing:

Sodium hydroxide (NaOH)	3.2-4.8 oz/gal (20-30 g/l)
Sodium carbonate (Na_2CO_3)	3.2-4.8 oz/gal (20-30 g/l)
Trisodium phosphate ($\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$)	6.4-9.6 oz/gal (40-60 g/l)
Non-ionic wetting agent	up to 1 g/l

(b) This solution may be contained in a mild steel tank and is operated at temperatures up to 90 deg C.

(c) The solution is to be analysed regularly and proportions maintained by addition, or discarded when no longer effective.

(4) Electrolytic alkaline cleaner.

(a) This is an aqueous solution containing:

Sodium hydroxide (NaOH)	12.8-19.3 oz/gal (80-120 g/l)
Sodium cyanide (NaCN)	1.28-1.60 oz/gal (8-12 g/l)

(b) The solution may be contained in a mild steel tank and is operated at room temperature, with the sides of the tank forming one electrode and the component forming the other. Direct current shall be applied at 6-8V and a reversing polarity unit shall be fitted. Components are cleaned by cycling the current for 20 seconds cathodically and 10 seconds anodically, finishing the cycle anodically. The operation is carried out for a sufficient time (usually about two minutes) to produce a clean surface.

(c) Analyse the solution regularly and maintain proportions by addition.

(5) Etching of low alloy steels.

(a) This is an aqueous solution containing:

Hydrochloric acid (HCl)	4.8-5.8 oz/gal (30-36 g/l)
-------------------------	-------------------------------

The solution can be made up by diluting 100 ml hydrochloric acid (SG 1.16) to one litre with water.

(b) The solution may be contained in a plastic tank and is used at room temperature. Components shall be immersed in the solution for approximately 1½-2 minutes.

(c) Replace the solution on laboratory advice.

TN44074

OLYMPUS 593

MK.610-14-28

OVERHAUL

(6) Electrolytic etching of steels.

Solution 'A'.

(a) This is an aqueous solution containing:

Sulphuric acid (H_2SO_4)	83.4-96.3 oz/gal (520-600 g/l)
------------------------------	-----------------------------------

One litre of the solution maybe made up as follows. Add 300 ml of sulphuric acid (SG 1.84) to 690 ml of water, slowly, with great care and stirring constantly. Allow to cool to room temperature and if necessary adjust to one litre by adding water.

- (b) The solution may be contained in a lead-lined tank fitted if necessary with cooling coils to maintain a temperature between 12-24 deg C. The sides of the tank may form one electrode and the component the other. Direct current shall be applied between 6-8V, a reversing polarity unit shall be fitted. Low alloy steel components shall be etched anodically for 30-60 seconds in either solution. Stainless steel components shall be etched in the solution for 30-60 seconds or anodically for 45 seconds followed by 15 seconds cathodically.
- (c) Analyse the solution regularly and maintain proportions by addition.

OLYMPUS 593

MK.610-14-28
OVERHAUL

(7) Etching of stainless steel and nickel base alloys.

(a) This is an aqueous solution containing:

Ferric chloride ($\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$)	40.1-52.9 oz/gal (250-330 g/l)
Hydrochloric acid (HCL)	8.7-10 oz/gal (54-62 g/l)

One litre of the above solution is made up by adding 170 ml of hydrochloric acid (SG 1.16) to 400 ml of water and stirring well. Add 300g of ferric chloride and make up the solution to one litre by adding water.

(b) The solution may be contained in a plastic tank and is used at room temperature. Components shall be immersed in the solution for up to 2 minutes.

(c) Replace the solution on laboratory advice.

(8) Nickel strike.

(a) This is an aqueous solution containing:

Nickel chloride ($\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$)	48.1-64.1 oz/gal (300-400 g/l)
Hydrochloric acid (HCL)	4-6.4 oz/gal (25-40 g/l)

One litre of the solution is made up by adding 400 g of nickel chloride to 750 ml of water while stirring until dissolved. Add 110 ml of hydrochloric acid (SG 1.16) while stirring and make up to one litre with water.

(b) The solution may be contained in a rubber lined or plastic tank and is used at room temperature. Components shall be cathodically treated for 1-2 minutes at 3.23-5.38 A/sq dm (30-50 A/sq ft). It is essential that the working voltage is applied to the bath before the components to be plated are immersed in the solution.

(c) Analyse the solution regularly and maintain proportions by addition.

(9) Nickel plating solutions.

(a) Solution 'A'.

This solution produces a soft ductile deposit of high internal stress and is an aqueous solution containing:

Nickel sulphate ($\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$)	38.4 oz/gal (250 g/l)
Boric acid (H_3BO_3)	4.8 oz/gal (30 g/l)
Nickel chloride ($\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$)	6.7 oz/gal (42 g/l)
or sodium chloride (NaCl)	3.2 oz/gal (20 g/l)

(b) Solution 'B'.

This solution produces a soft ductile deposit of low internal stress and is an aqueous solution containing:

Nickel sulphamate ($\text{Ni}(\text{SO}_3\text{NH}_2)_2 \cdot 4\text{H}_2\text{O}$)	68 oz/gal (425 g/l)
Nickel chloride ($\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$)	1.6 oz/gal (10 g/l)
Boric acid (H_3BO_3)	5.6 oz/gal (35 g/l)

- (c) The solutions may be contained in plastic or P.V.C. lined tanks continuously filtered and agitated by compressed air. Depolarised nickel anodes contained in terylene bags, or nickel pellets or squares contained in a Titanium basket, are used and plating is carried out at current densities as follows:

Solution 'A' up to 3.23 A/sq dm (30 A/sq ft)
Solution 'B' up to 6.45 A/sq dm (60 A/sq ft).

It is essential that the working voltage is applied to the bath before the components to be plated are immersed in the electrolyte.

**OLYMPUS 593**

MK.610-14-28

OVERHAUL

- (d) Freshly prepared solutions must be purified before use and at intervals on laboratory advice. Distilled or demineralized water must be used to maintain the solution volume. Analyse the solution regularly and maintain proportions by addition. Nickel salts must be dissolved in a quantity of plating solution in a separate tank, purified and then introduced into the main tank. The pH value (acid/alkaline content) must be checked daily and corrected by the addition of sulphuric or sulphamic acid or nickel carbonate.

Solution 'A'

Nickel sulphate content (as $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$)	32-40 oz/gal (200-250 g/l)
Boric acid content (H_3BO_3)	2.4-4.8 oz/gal (15-30 g/l)
Chloride content (as Cl_2)	1.4-1.9 oz/gal (9-12 g/l)
pH value (electrometric)	4.5-5.5
Temperature	40-45 deg C

Solution 'B'

Nickel content (as Ni)	10.4-12 oz/gal (65-75 g/l)
Boric acid content (H_3BO_3)	4.8-5.6 oz/gal (30-35 g/l)
Chloride content (as Cl_2)	0.32-0.64 oz/gal (2-4 g/l)
pH value (electrometric)	3.5-4.5
Temperature	45-50 deg C

D. Stripping Existing Plating.

NOTE: If component geometry permits, the nickel plating may be removed by machining as an alternative to chemical stripping.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning).
- (2) Immerse the component into the appropriate stripping solution.
- (3) Rinse in clean, cold running water and dry using a clean, dry air blast.
- (4) Unless the component is to be re-plated immediately, apply approved de-watering oil as a temporary protective.

E. Stress Relieving and De-embrittlement.

- (1) After final machining and prior to nickel plating, steel components other than those manufactured from a fully austenitic steel shall be degreased (Ref. 72-09-00 Cleaning).

- (2) Stress relieve/de-embrittle:

Tensile Strength or Hardness

Stress Relief
Heat Treatment.

Less than 1000 MN/M² (65 ton f/

OVERHAUL

F. Preparation.

- (1) Stress relieve the component if required as specified in the appropriate Repair Chapter.
- (2) Mount the component in a jig or suitably wire with copper.
- (3) Vapour degrease the component (Ref.72-09-00 Cleaning) or locally degrease the area to be plated using a clean, lint-free cloth moistened with trichloroethane.
- (4) Mask off areas not to be plated using a suitable masking medium.
- (5) Clean the component by immersing in the hot alkaline cleaner or electrolytically in the cold alkaline cleaner.
- (6) Wash the component in clean, cold running water.
- (7) Etch the component by the method approved for the material type.
- (8) Wash the component in clean, cold running water.

G. Nickel Plating.

- (1) Immediately after etching and if instructed by the Repair Chapter immerse the component in the nickel strike solution.
- (2) Wash the component in clean, cold running water.
- (3) Quickly transfer to the nickel plating bath and continue plating in accordance with the instructions and conditions previously stated until the required thickness of deposit is obtained.
- (4) Wash the component in a drag out tank and then in clean, cold running water.
- (5) Immerse in clean hot water and dry off.

FN44080

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) Remove all traces of masking, jig and copper wire and ensure the component is in a clean condition.
- (7) Subject the component to de-embrittlement if required as specified in the appropriate Repair Chapter. Carry out the de-embrittlement as soon as possible and not later than 16h after plating.
- (8) Apply approved de-watering oil as temporary protective.

NOTE: The temporary protection may be deferred until after inspection if the latter is carried out within 8h of de-embrittlement.

H. Inspection After Plating.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning).
- (2) Visually inspect the component to ensure that the plating is smooth, adherent and free from burns and blisters.
- (3) Check the plating thickness using appropriate approved methods.

J. Finishing.

- (1) Grind the deposit if required to the dimensions specified in the appropriate Repair Chapter.
- (2) Carry out a crack detection test if required as specified in the appropriate Inspection/Check Chapter.
- (3) Visually re-inspect the deposit after grinding to ensure adhesion, smoothness and free from burns.
- (4) Apply approved de-watering oil as a temporary protective.

COMBUSTION SPRAYING - REPAIR

1. Application of Combustion Spraying

A. General.

- (1) Combustion spraying is a method of depositing unfused coatings of metal, cermet, ceramic, plastic and composite materials onto engine components. It is generally used as a heat barrier, to provide an erosion resistant surface, or to provide an abradable surface to maintain running clearances during service.
- (2) The components to be sprayed and the type of coating and areas to be covered etc. are specified in the relevant Repair Chapter. Deposition parameters for Rokide 'A' and Rokide 'Z' are tabulated in Table 402 and 403 respectively, and the specific parameters or alternatives to be used will be specified in the relevant Repair Chapter.

B. Safety Precautions.

- (1) Combustion spray equipment emits glare and has a high noise level. It should, therefore, be sited in such a position that personnel other than those operating the equipment are not continually affected. Sound proofing and screening may be necessary to facilitate this.
- (2) Operators shall wear safety glasses, ear defenders, high necked dark overalls and gloves.
- (3) Additional safety glasses and ear defenders shall be available and be worn by other personnel in the combustion spraying area.
- (4) Hoses must not be allowed to trail on the floor or be used in a damaged condition.
- (5) Certain materials emit dangerous fumes during spraying. Therefore, adequate protection must be provided for operators spraying these materials.

OLYMPUS 593

MK.610-14-28

OVERHAUL

SNECMA

C. Process Control.

- (1) Equipment settings must be adhered to and the condition of the gun must be continually monitored.
- (2) Spray materials shall be kept in a satisfactory condition. Powder must be kept dry. Wire and cord must be kept free from corrosion, moisture and mechanical damage. Rods must not be broken during handling or storage.
- (3) Powder feed systems should be regularly maintained. They should be cleaned out at the end of each shift and whenever a change of powder is to be made.
- (4) Preheating temperatures must not be such as to cause distortion of the component, or to destroy the properties of the material or any other previously applied treatments.

D. Preparation.

- (1) The component shall be vapour degreased (ref.72-09-00, Cleaning).
- (2) Areas which do not require abrasive blasting are to be masked off. Holes and passages are to be similarly protected, preferably by means of plugs.
- (3) The areas to be sprayed shall be abrasive blasted to provide a clean keying surface. After blasting the residual dust shall be removed using a clean, dry air blast.
- (4) The blasted areas shall show a roughened surface of uniform matt texture. If necessary the blasting shall be repeated until this is achieved.
- (5) If it is necessary to remove the masking, extreme care shall be taken to avoid contaminating the areas to be sprayed. If contamination does occur, the preparation procedure shall be repeated.
- (6) The areas which do not require spraying are to be masked off (if not previously masked), taking extreme care not to touch or otherwise contaminate the areas to be sprayed.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (7) Powders shall be thoroughly mixed and sieved if necessary, before use.

E. Pre-heating.

- (1) If required, components are to be pre-heated to a pre-determined temperature before spraying.
- (2) Small components may be pre-heated by the spray gun with the material supply cut off.
- (3) Large or high density components shall be pre-heated in a suitable oven.

F. Spraying.

- (1) Components shall be sprayed with the minimum of delay after preparation. The time lag between blasting and spraying must not exceed two hours, during which time the component must be kept in a clean, dry condition. If spraying is not commenced within this time, the preparation procedure must be repeated.
- (2) Spraying facilities must be equipped with a suitable fume extraction system.
- (3) Facilities should be available for the component to be rotated if necessary. Ideally both the component and the gun should be capable of being mechanically driven and controlled relative to one another during spraying.
- (4) On some components a bond coat may be required. This must be applied with the minimum of delay after blasting, and immediately before spraying the top coat.
- (5) The gun shall be angled so that the direction of spray is as near as possible 90 deg to the surface, and never less than 50 deg.
- (6) Cooling shall be arranged so that the flow of sprayed material is unimpeded.
- (7) To ensure repeatability, spray parameters shall be critically controlled.

- (8) If a machining allowance is required it will be detailed in the relevant Repair chapter.

G. Inspection After Spraying.

- (1) The deposit shall be inspected dimensionally, for uniformity of deposit and to ensure that there is no evidence of blistering, lifting, cracking or chipping.
- (2) If the deposit is faulty it must be completely removed prior to re-processing.

H. Finishing.

- (1) The deposit shall be finished if required as detailed in the relevant Repair chapter.

J. Inspection After Finishing.

- (1) A visual inspection shall be carried out using magnification up to X7 where necessary. A satisfactory deposit has a matt finish in which the machining marks are clearly visible. There shall be no evidence of discolouration, cracking, plucking or polishing.

NOTE: The inspection of ground deposits is very important in order that the grinding operation may be monitored. This is necessary due to the possible rapid deterioration of the grinding wheels.

- (2) If the deposit is faulty it must be completely removed prior to re-processing.

K. Fluorescent Penetration Examination of Metal Spraying After Finishing.

- (1) It is assumed that the fluorescent penetrant examination equipment in use is capable of accommodating each of the components to be examined and that the operator is fully conversant with its operation.

WARNING: WEAR P.V.C. GLOVES TO PROTECT HANDS FROM PENETRANT FLUIDS, SKIN DISEASE MAY RESULT.

- (2) Carry out fluorescent penetrant examination.

TN6615

OLYMPUS 593

MK.610-14-28

OVERHAUL

snecma

- (3) The approved system (S7) uses the penetrant Ardrex 985/P3.
- (4) Degreasing prior to inspection is by vapour degreasing using Triklone N only, or by swab degreasing using a group 2 or 4 solvent (Refer to 72-09-00 - Cleaning).
- (5) Degreasing after inspection is by vapour degreasing using Triklone N.
- (6) Details of the procedure are quoted in Table 401.

L. Removing Faulty Deposits.

- (1) Faulty deposits may be removed by machining or by a chemical method approved by the engine manufacturer.

M. Nozzle Type 3815/Rod Control.

- (1) Measure each rod in a new batch and establish the maximum diameter.
- (2) Drill out the nozzle to give approx. 0.0008 in (0,20mm) tolerance above the maximum rod diameter. A new nozzle is supplied undersize due to the inconsistency in shape and diameter of the rods.
- (3) Pass each rod through the gun prior to spraying, any irregular shaped rod should be rejected.

PLASMA SPRAYING - REPAIR

I. Application of Plasma Spraying for Hard-faced Coatings

A. General.

- (1) Plasma spraying is a method of depositing metal, metal alloy, cermet, ceramic and composite powders onto engine components. It is used to provide a wear-resistant surface and/or to build-up worn components, especially bearing locations on shafts and in housings.
- (2) This repair method is only to be used when specifically referenced in a particular repair. The repair will detail all parameters, e.g. type of masking, grit blasting details, type of gun and its settings, etc., applicable to the component concerned.

B. Safety Precautions.

- (1) Plasma spray equipment emits ultra-violet light and has a high noise level. It should, therefore, be sited in such a position that personnel other than those operating the equipment are not continually affected. Sound proofing and screening may be necessary to facilitate this.
- (2) Operators shall wear a welder's helmet, safety glasses, ear defenders, high necked dark overalls and gloves.
- (3) Additional safety glasses and ear defenders shall be available and be worn by other personnel in the plasma spraying area.
- (4) Certain materials and gases are explosive. Hoses and fittings must be fully serviceable and hoses must not be allowed to trail on the floor.
- (5) A suitable fume extraction system shall be provided. This system must be operating before the gun is lit.

TN1582

REPAIR

72-09-11

Page 401
Oct 1/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

C. Process Control.

- (1) Equipment settings must be continually monitored.
- (2) Electrodes shall be examined at the beginning of each shift and their arc life recorded.
- (3) The relationship of operating current/voltage to power level must be monitored at least twice during each shift. Hydrogen flow must not be varied to compensate for change of voltage.
- (4) The powder feed system shall be checked daily for wear and deterioration.
- (5) Powders must be kept in a dry condition, preferably in heated containers.
- (6) Preheating temperatures must not be such as to cause distortion of the component, or to destroy the properties of the material or any other previously applied treatments.

D. Test Piece Control.

- (1) A test piece shall be sprayed and subjected to a bend test at the beginning of each half shift and whenever electrodes, powder batches or powder types are changed.
- (2) A recording system must be maintained for tests conducted. An increase in testing frequency may be required for particular techniques at the discretion of the quality and inspection departments of the facility concerned.
- (3) The test piece shall be 18 swg mild steel sheet of minimum dimensions 2 x 3 in. (50 x 75 mm). Other materials may be used at the discretion of the controlling laboratory.
- (4) The test piece shall be prepared, preheated and sprayed under standardized conditions.

TN1583

REPAIR

72-09-11

Page 402

MK.610-14-28

OVERHAUL

- (5) A coating of 0.006 ± 0.001 in. ($0,15 \pm 0,025$ mm) shall be deposited on the prepared piece without overheating.
- (6) The test piece shall then be bent mechanically through 90 deg at a slow and deliberate rate round a 0.5 in. (12,5 mm) diameter mandrel. This test must be carried out with the deposit on the outside of the bend.
- (7) A satisfactory result is indicated if the deposit exhibits no evidence of lifting or spalling from the panel. A minimum amount of cracking in the bend is acceptable with certain low ductility deposits.
- (8) Assessment of deposit structure and hardness shall be made for each new batch of powder.
- (9) If the results are not satisfactory, the equipment, parameters and technique must be critically examined to correct faulty deposition. Spraying of components may be commenced only when a satisfactory bend test has been produced.

E. Preparation.

- (1) The component shall be vapour degreased (Ref.72-09-00 Cleaning) or locally degreased using a clean, lint-free cloth moistened with trichloroethane.
- (2) Areas which do not require abrasive blasting are to be masked off.
- (3) The areas to be sprayed shall be abrasive blasted to provide a clean keying surface. After blasting the residual dust shall be removed using a clean, dry air blast.
- (4) The blasted areas shall show a roughened surface of uniform matt texture. If necessary the blasting shall be repeated until this is achieved.

- (5) If it is necessary to remove the masking, extreme care shall be taken to avoid contaminating the areas to be sprayed. If contamination does occur, the preparation procedure shall be repeated.
- (6) The areas which do not require spraying are to be masked off (if not previously masked), taking extreme care not to touch or otherwise contaminate the areas to be sprayed.
- (7) The powder shall be thoroughly mixed before use.

F. Pre-heating.

- (1) If required, components are to be pre-heated to a pre-determined temperature before spraying.
- (2) Small components may be pre-heated by the spray gun with the powder supply cut off.
- (3) Large or high density components shall be pre-heated in a suitable oven.

G. Spraying.

- (1) Components shall be sprayed with the minimum of delay after preparation. The time lag between blasting and spraying must not exceed two hours, during which time the component must be kept in a clean, dry condition. If spraying is not commenced within this time, the preparation procedure must be repeated.
- (2) Facilities should be available for the component to be rotated if necessary. Ideally both the component and the gun should be capable of being mechanically driven and controlled relative to one another during spraying.
- (3) On some components a bond coat may be required. This must be applied with the minimum of delay after blasting, and immediately before spraying the top coat.

- (4) The gun shall be angled so that the direction of spray is as near as possible 90 deg to the surface, and never less than 50 deg.
- (5) Cooling shall be arranged so that the flow of sprayed material is unimpeded.
- (6) To ensure repeatability, spray parameters shall be critically controlled.
- (7) If a machining allowance is required it will be detailed in the relevant Repair Chapter.

H. Inspection After Spraying.

- (1) The deposit shall be inspected dimensionally, for uniformity of deposit and to ensure that there is no evidence of blistering, lifting, cracking or chipping.
- (2) If the deposit is faulty it must be completely removed prior to reprocessing.

J. Finishing.

- (1) The deposit shall be finished if required as detailed in the relevant repair.
- (2) If buffing is specified the surface should be buffed until it appears or feels smooth.

K. Inspection After Finishing.

- (1) After machining a visual inspection shall be carried out using magnification up to X7 where necessary. A satisfactory deposit has a matt finish in which the machining marks are clearly visible. There shall be no evidence of discolouration, cracking, plucking or polishing.

NOTE: The inspection of ground carbide deposits is very important in order that the grinding operation may be monitored. This is necessary due to the possible rapid deterioration of the grinding wheels.

(2) After buffing a visual inspection shall be carried out. A satisfactory deposit shall exhibit no blistering, lifting, cracking or chipping.

(3) If the deposit is faulty it must be completely removed prior to reprocessing.

L. Fluorescent Penetration Examination of Metal Spraying After Finishing.

NOTE: This examination technique is only required to confirm suspected machining abuse, faulty deposition, or if instructed by the Repair Chapter.

(1) It is assumed that the fluorescent penetrant examination equipment in use is capable of accommodating each of the components to be examined and that the operator is fully conversant with its operation.

WARNING: WEAR P.V.C. GLOVES TO PROTECT HANDS FROM PENETRANT FLUIDS, SKIN DISEASE MAY RESULT.

(2) Carry out fluorescent penetrant examination.

(3) The approved penetrant system (S7) is detailed in Table 401.

(4) Refer to Table 402 for the Process S7.

(5) All components must be degreased using Triklone N only.

M. Removing Faulty Deposits.

(1) Faulty deposits may be removed by machining or by a chemical method approved by the engine manufacturer.

PLASMA WELDING - REPAIR

1. Plasma Welding for Titanium Components

A. General.

- (1) Plasma welding is a process using a high temperature stream of ionized gas as the heat source. The plasma gas torch is water cooled, with de-mineralised water, and the arc produced by the welding power supply. During welding the electric arc passes through a constricted flow of gas producing a gas jet with arc temperatures of approx. 15,000°C. A secondary shielding gas flow is provided around the plasma arc column to prevent oxidation of the molten weld metal.
- (2) Use this repair procedure only when specifically referenced. The Repair Chapter will detail all parameters, e.g. type of equipment, settings etc.

B. Safety Precautions.

- (1) The plasma welding process emits ultra violet light. It should therefore be sited in such a position that personnel other than those operating the equipment are not continually affected, screening may be necessary to facilitate this.
- (2) Operators must wear a welders helmet and high necked dark overalls. The following glass shades are recommended.

OVERHAUL

- (3) Swab degreasing with inflammable liquids must only be carried out in a well ventilated booth fitted with a fume extraction system, the operator must wear protective gloves.

WARNING: CERTAIN GASES USED DURING THE PROCESS ARE EXPLOSIVE. HOSES MUST BE SERVICEABLE AND NOT ALLOWED TO TRAIL ON FLOOR.

C. Types of Plasma Welding.

- (1) Transferred arc.
 - (a) Transferred arc is the term used when the arc current passes through the plasma stream from the torch electrode to an earthed workpiece.
- (2) Non-transferred arc.
 - (a) Non-transferred arc is the term used when the arc current passes through the plasma stream from the torch electrode to an earthed torch nozzle holder.
- (3) Direct current (DC) welding.
 - (a) Straight polarity welding is the term used when the workpiece is connected positive and the torch electrode connected negative.
 - (b) Reverse polarity welding is the term used when the workpiece is connected negative and the torch electrode connected positive.

D. Weld Techniques.

- (1) Keyhole welding.
 - (a) When this technique is used, a hole is produced at the leading edge of the weld pool, where the plasma jet displaces the molten metal, expelling plasma gas and arc vapour beneath the weldment. Surface tension causes the molten metal to flow in behind the keyhole to form the weld bead. This technique should not be used for components thinner than 0.080 in. (2,03 mm).

TN18407

OLYMPUS 593

MK.610-14-28
OVERHAUL

(2) Conduction welding.

- (a) Heat from the plasma arc melts the material by conduction through the workpiece, this technique should be used on all components thinner than 0.080 in. (2,03 mm).

E. Shielding and Backing Gas Supplies.

- (1) The hydrogen content of any gas supply used during plasma welding must not exceed 8 per cent.
- (2) The selection of plasma and shielding gases is related to the material to be welded, both will be specified in the relevant Repair Chapter.
- (3) In most cases argon backing is required during welding and is most effectively applied by means of backing bars. Sufficient volume must be allowed in the backing bar channels to take the keyhole plasma gas stream which issues beneath the weldment.
- (4) Should the use of backing bars be impractical, an area behind the weld must be sealed off, except for feed and bleed orifices, then purged with argon and a continuous supply of argon allowed to flow during welding.

CAUTION: WHERE COPPER OR COPPER ALLOY BACKING BARS ARE USED AVOID CONTACT WITH THE WORKPIECE.

F. Electrodes.

- (1) Non-consumable torch electrodes, for use with DC power sources must be of thoriated tungsten containing 1 to 2½ per cent thorium.
- (2) Tungsten electrodes must be straight throughout their length and may be swaged or finished by centreless grinding. Ovality is restricted to 0.005 in. (0,13 mm) and the stipulated diameter must be within a minus tolerance of 0.005 in. (0,13 mm).

- (3) The electrode tip geometry must conform to the equipment manufacturers recommendation.

G. Process Control.

NOTE: It is important when applying plasma weld to exclude draughts from the working area.

- (1) Components must be degreased in accordance with the Repair Chapter.
- (2) Equipment settings must be continually monitored.
- (3) A test piece which simulates the repair component geometry must be inspected, as instructed in the relevant Repair Chapter, and approved by the local controlling laboratory before the repair welding commences.
- (4) Each completed weld run must be cleaned using a rotary stainless steel wire brush.
- (5) Remove all weld bead irregularities at the completion of each weld run. Small irregularities may be removed by polishing. In the event of major irregularities within the weld bead, remove the relevant section, by grinding, and apply a new bead.

VAPOUR BLASTING - REPAIR

1. Application of Vapour Blasting

A. General.

- (1) The process is used for cleaning surfaces, as a preparation for further processing or it may also be used to introduce a compressive stress into the surface layer of metallic parts to improve fatigue strength. The abrasive medium is suspended in water, delivered to a nozzle at low pressure then accelerated by compressed air.
- (2) Use a standard vapour blast cabinet with automatic timing device.
- (3) Use this process only when specifically referenced in a Repair Chapter. Deposition parameters for various repairs are tabulated at the end of this chapter.

B. Safety Precautions.

- (1) All apparatus must be earthed to ensure dispersion of any heavy charge which might be generated during the process.
- (2) Cabinets must be fitted with explosion doors and continuous low speed air extraction.
- (3) A face mask and apron must be worn when cleaning the exhaust filters.

C. Abrasive.

- (1) Aluminium oxide grit must be lead free virgin fused alumina containing less than 5 ppm elemental lead and less than 20 ppm total lead compounds. The iron content, as acid extractable iron, must be less than 1 per cent ww.

PRINTED IN ENGLAND

TN22411

REPAIR

OLYMPUS 593

MK.610-14-28
OVERHAUL

D. Process Control.

NOTE: It is recommended that separate blasting cabinets are used for the treatment of steels and light alloys to minimise damage to components from metallic contamination.

- (1) A sample of abrasive and water must be collected daily from the delivery nozzle with the air supply switched OFF. The sample must be allowed to settle in a graduated tube so that the proportions of grit, fines and water may be measured.
- (2) Grit content must be over 20 per cent by volume and the fines less than 10 per cent of the solid content. Add new grit in small amounts to prevent excessive surface erosion.
- (3) The component must be degreased in accordance with the Repair Chapter.
- (4) Component surface areas which do not require blasting must be protected by masks or blanks as specified in the Repair Chapter.
- (5) Before blasting any component ensure the blast intensity is correct (Ref.para.E.).
- (6) After treatment wash the component thoroughly in cold running water to remove all traces of abrasive. The component must then be immersed in hot inhibited water for a period long enough to attain the temperature of the water then allowed to dry off. Drying may be assisted by the use of a clean dry air blast.
- (7) If specified by the Repair Chapter passivate the component (Ref.para.G.).

E. Blast Intensity.

- (1) Blast intensity is monitored by using an appropriate Almen test strip (Ref.Fig.401) as specified in the tables.

- (2) The test strip must be held flat in a fixture and blasted, ensuring uniform coverage of the exposed surface, under the same parameters as the component it represents.
- (3) After removal from the fixture, the test strip will assume an upward curve. The amount of deflection from the flat or 'arc height' must be measured after blasting to ensure equipment settings and operation are correct.
- (4) Blast intensity must be checked at every change of equipment setting or component, and at four hourly intervals.

F. Inspection.

- (1) Visually inspect the treated areas to ensure all traces of differentiated grain or grain boundary etching are removed and the surface shows uniform matt finish.

G. Passivation Solution.

CAUTION: USE THIS SOLUTION ONLY WHEN REFERENCED IN
A REPAIR CHAPTER.

- (1) The solution, made up in the following proportions should be contained in a stainless steel or polypropylene tank and used at workshop temperature.

Nitric acid (SG 1.42)	28 per cent V/V
Water	72 per cent V/V

- (2) Fully or partially immerse components in the solution for as long as instructed by the Repair Chapter. On removal from the solution, allow the component to drain then wash thoroughly in clean running water. Dry in a warm oven or with clean warm air.
- (3) Regularly analyse the solution and maintain the proportions of water or acid by addition.

ETCHING - REPAIR

1. Component Etching Prior to Inspection/Re-Finishing

A. General.

Etching is used to prepare the surface of highly stressed parts for inspection. The process produces an even matt surface finish which reveals inclusions and surface defects, including faults too small to be seen with the naked eye.

CAUTION: THE PROCESSES MUST BE STRICTLY CONTROLLED AND USED ONLY WHEN SPECIFICALLY REFERENCED IN A REPAIR CHAPTER.

B. Safety Precautions.

WARNING: ETCHING SOLUTIONS ARE CORROSIVE. OPERATORS MUST WEAR COMPLETE BODY PROTECTIVE CLOTHING AND FACE MASKS.

- (1) Safety notices must be displayed in conspicuous places throughout the process area.
- (2) The nearest surgery or first aid post must be made aware of the etching solution constituent acids.
- (3) Eyewash bottles should be provided and be easily accessible to the operator.
- (4) Should skin become contaminated with the etching solution, wash thoroughly in clean running water then seek medical attention.

C. Solutions.

- (1) Solutions must be made up as specified at the end of this chapter and their chemical composition monitored by the local controlling laboratory.
- (2) A fume extraction system should be provided and solution containers covered with suitable lids when not in use.

OLYMPUS 593

MK.610-14-28
OVERHAUL

D. Etching.

(1) Immersion etching.

- (a) Prior to etching, components must be degreased as specified in the Repair Chapter then allowed to cool to workshop temperature. Operators must avoid physical contact with the components after degreasing.
- (b) Component mating faces, and those specified in the repair, must be protected with a suitable masking compound.
- (c) When components are immersed in the etching solution, reaction does not commence immediately due to removal of natural surface oxides. This reaction time, normally less than 30 seconds, must be checked with each new make-up of solution and at intervals during its life.
- (d) Immersion time, excluding reaction time, and the relevant etching solution will be specified in the Repair Chapter.

(2) Swab etching.

- (a) Ensure that the component is at room temperature.
- (b) Swab degrease the area to be etched (Ref. 72-09-00, Cleaning).
- (c) Dry the component with a clean lint-free cloth.
- (d) Swab the area to be etched with a small wad of cotton wool soaked with the etching solution.

E. Washing.

- (1) On removal from the etching solution or after swab etching, components must be thoroughly washed, preferably with an air/water gun in clean cold running water. If necessary, brush lightly to remove smut.
- (2) After washing, components that have been immersion etched must be neutralised in accordance with the procedure of paragraph F.

TN21635

OLYMPUS 593

MK.610-14-28

OVERHAUL

F. Neutralising.

(1) Neutralising solutions.

(a) These solutions must be contained in a PVC tank and used at room temperature. When ammonia is used, the tank shall be fitted with fume extraction.

(b) Chemical composition. Aqueous solutions containing:

Sodium Carbonate (Na_2CO_3)... 40 to 60 g/l

or

Sodium Metasilicate

($\text{Na}_2\text{SiO}_3 \cdot 5\text{H}_2\text{O}$)

... 25 to 35 g/l

or

Ammonia (NH_3)

... 9 to 18 g/l

(c) The solutions may be made up as follows:

One litre of solution may be made up by adding either 60 gms of sodium carbonate, or 35 gms of sodium metasilicate, or 50 mls of ammonia solution (SG 0.880) to 900 mls of cold water. Stir until dissolved or mixed, then make up to a volume of 1 litre with cold water.

(2) Immerse the component in the neutralising solution.

(3) Wash the component in cold water to remove all traces of the neutralising solution.

(4) Immerse the component in clean hot water at 80 deg C (minimum) then, when the component has attained the water temperature, remove it and dry it with oil-free compressed air. Cotton gloves should be worn for subsequent handling of the component.

G. Solution A.

(1) The solution must be contained in a polythene or PVC lined mild steel tank fitted with suitable fume extraction. The temperature of the solution shall not exceed 25 deg C.

(2) Chemical composition. An aqueous solution containing:

Hydrofluoric Acid (HF) ... 30 g/l

Nitric Acid (HNO_3) ... 200 g/l

REPAIR

72-09-14

Page 403

Dec 1/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) The solution may be made up as follows:

One litre of solution may be made up by carefully adding 220 mls of concentrated nitric acid (SG 1.42) to 600 mls of cold water with constant stirring. Allow to cool to room temperature, then carefully add either 135 mls (20% W/W), 80 mls (40% W/W) or 45 mls (60% W/W) of hydrofluoric acid with constant stirring and make up to a volume of 1 litre with cold water.

- (4) Components may be immersed in the solution for up to 30 seconds, or as detailed in the respective Repair Chapter, from the commencement of the reaction, which will be identified by gassing.

H. Solution B.

- (1) The solution must be contained in a stoneware or polythene tank and used at workshop temperature.
- (2) Chemical composition. An aqueous solution containing:

Ferric chloride (Fe Cl_3)	...	260-310 g/l
Hydrochloric acid (HCl)	...	40-50 g/l

- (3) The solution may be made up as follows:

Ferric chloride solution (SG 1.3)	80 per cent v.v.
Hydrochloric acid (SG 1.16)	10 per cent v.v.
Water	10 per cent v.v.

- (4) Components may be immersed in the solution for up to 60 seconds or as detailed in the respective Repair Chapter.

J. Solution C.

- (1) The solution must be contained in a PVC tank, fitted with a suitable fume extractor and used at a temperature not exceeding 25 deg C.
- (2) Chemical composition. An aqueous solution containing:

Ferric chloride (Fe Cl_3)	...	460 to 520 g/l
Hydrochloric acid (HCl)	...	35 to 55 g/l
Hydrofluoric acid (HF)	...	10 to 20 g/l

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (3) The solution may be made up as follows:

One litre of solution may be made up by carefully adding 140 mls of concentrated hydrochloric acid (SG 1.14) and 20 mls of hydrofluoric acid (60% w/w) to 400 mls of cold water whilst stirring. Allow to cool to room temperature, then carefully add 840 gms of solid ferric chloride ($\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$) and stir until dissolved. Make up to a volume of 1 litre with cold water whilst constantly stirring.

K. Solution D.

- (1) The solution must be contained in a stoneware or polythene tank and used at a temperature not exceeding 25 deg C.

- (2) Chemical composition. An aqueous solution containing:

Ferric chloride (Fe Cl_3)	...	200-240 g/l
Hydrochloric acid (Hcl)	...	20-30 g/l

- (3) The solution may be made up as follows:

Ferric chloride liquor				
(SG 1.3)	60 per cent v.v.
Hydrochloric acid (Hcl)				
(SG 1.16)	7 per cent v.v.
Water	33 per cent v.v.

- (4) Components to be immersed in the solution for a maximum period of 30 seconds or as detailed in the respective Repair Chapter or Service Bulletin.

L. Solution E.

- (1) The solution must be contained in a stoneware or polythene tank and used at workshop temperature.

- (2) Chemical composition. An aqueous solution containing:

Ferric chloride (Fe Cl_3)	...	250 to 300 g/l
Hydrochloric acid (Hcl)	...	100 to 120 g/l

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) To make approximately 1 litre of the solution, use the following quantities:

Hydrated ferric chloride ($\text{Fe Cl}_3 \cdot 6\text{H}_2\text{O}$)	... 500 g
Commercial hydrochloric acid (SG 1.18)	... 375 ml
Water...	... 343 ml

- (4) Maintain a film of the solution on the component surface for approximately 15 seconds or as detailed in the respective Repair Chapter.

M. Solution F.

- (1) The solution must be contained in a plastic or plastic lined tank and used at a temperature of 15 to 25 deg C.
- (2) Chemical composition. An aqueous solution containing:

Ferric Chloride Liquor (SG 1.3)	... 70 per cent v.v.
Hydrochloric Acid (SG 1.16)	... 10 per cent v.v.
Hydrofluoric Acid (60 per cent W.W.)	... 10 per cent v.v.
Water...	... 10 per cent v.v.

2. Grinding Control Etching

A. General.

This etching process is used to produce a component surface finish, with minimal loss of metal, which will reveal incorrect grinding technique.

CAUTION: USE THIS PROCESS ONLY WHEN SPECIFICALLY REFERENCED.

B. Safety Precautions.

Observe the safety precautions in para.1.B.

C. Solutions.

- (1) Alkaline cleaning solution:

An aqueous solution containing either

Orthosil F2 or Metsopol ... 50 g/l

Use the solution at a temperature of 90 to 100 deg C.

(2) Etching solution:

Nitric acid (SG 1.42)	...	1 per cent v.v.
Water	99 per cent v.v.

(3) De-smutting solution:

Hydrochloric acid				
(SG 1.16)	2 per cent v.v.
Water	98 per cent v.v.

(4) Neutralising solution:

An aqueous solution containing either

Sodium carbonate				
(Na_2CO_3)	40-60 g/l
or				
Sodium metasilicate				
($\text{Na}_2\text{SiO}_3 \cdot 5\text{H}_2\text{O}$)	25-35 g/l

D. Etching.

Subject the component to the following procedure.

- (1) Vapour degrease (Ref.72-09-00 Cleaning) then allow to cool to workshop temperature.
- (2) Immerse for approximately 10 minutes in the alkaline cleaning solution.
- (3) Wash in cold running water.
- (4) Immerse in the etching solution for a period of 10 to 30 seconds until a satisfactory etch is obtained.
- (5) Wash in cold running water.
- (6) Immerse in the de-smutting solution for 10 to 15 seconds.
- (7) Wash and scrub with a soft bristle brush in cold running water.
- (8) Rinse in the neutralising solution.
- (9) Immerse in hot water then dry off.
- (10) Immerse in an approved de-watering oil.

CONTROLLED SHOT AND GLASS BEAD PEENING - REPAIR

1. Application

A. General.

- (1) The process is used to introduce a compressive stress into the surface layers of components to improve fatigue strength and fretting resistance, and to prevent stress corrosion cracking.
- (2) The peening medium may be spherical metal shot or spherical glass beads delivered either by controlled centrifugal force or air pressure from a nozzle.
- (3) Glass bead peening may be carried out wet or dry, but is safer when used wet. It may be used to remove iron contamination from titanium or aluminium alloy components.
- (4) Use this process only when specifically referenced in a Repair Chapter. Deposition parameters for various repairs are tabulated at the end of this chapter.

B. Safety Precautions.

- (1) Operators must avoid physical contact with powdered glass.
- (2) A face mask and apron must be worn when cleaning the exhaust filters.
- (3) All apparatus must be earthed to ensure dispersion of any heavy charge which might be generated during the process.
- (4) Cabinets must be fitted with explosion doors and continuous low speed air extraction. Dry glass bead peening must be carried out in a reduced pressure cabinet.

PRINTED IN ENGLAND

OLYMPUS 593

MK.610-14-28
OVERHAUL

C. Process Control.

CAUTION: PEENING CAUSES FLOW OF THE SURFACE LAYER.
ENSURE FLAW DETECTION IS CARRIED OUT BEFORE
PEENING.

- (1) Ensure the component is degreased in accordance with the Repair Chapter.
- (2) Component surface areas which do not require peening must be protected by masks or blanks as specified in the Repair Chapter.
- (3) Before peening any component ensure the peening intensity is correct (Ref.para.D).
- (4) Metal shot peening.
 - (a) After shot peening, use a clean dry air blast or a soft brush to remove dust and grit.
 - (b) Iron contamination may be removed by wet glass bead peening.
- (5) Glass bead peening.
 - (a) Spherical glass beads must be silicone free and to the size specified in the Repair Chapter.
 - (b) A sample of slurry must be taken daily from the delivery nozzle with the air supply switched OFF. The sample must be allowed to settle in a graduated tube so that the proportions of beads, fines and water may be measured.
 - (c) Bead content must be over 20 per cent by volume and the fines less than 10 per cent of the solid content.
 - (d) After treatment wash the component thoroughly in cold running water to remove all traces of the peening medium. The component must then be immersed in hot inhibited water for a period long enough to attain the temperature of the water then allowed to dry off. Drying may be assisted by the use of a clean dry air blast.
- (6) If specified by the Repair Chapter passivate the component (Ref.para.F).

D. Peening Intensity.

- (1) Peening intensity is monitored by using an appropriate Almen test strip (Ref.Fig.401) as specified in the Repair Chapter.
- (2) The test strip must be held flat in a fixture and peened, ensuring uniform coverage of the exposed surface, under the same parameters as the component it represents.
- (3) After removal from the fixture, the test strip will assume an upward curve. The amount of deflection from the flat or 'arc height' must be measured after peening to ensure equipment settings and operation are correct (Ref.Figs.401 and 402).
- (4) Peening intensity may be specified in the Repair Chapter as a range of intensities. For example, an intensity of 8-12A denotes an arc height between 0.008 in. and 0.012 in. on a Almen type A test strip. Similarly, an intensity of 4-8N denotes an arc height between 0.004 in. and 0.008 in. on an Almen type N test strip.
- (5) Tests should be carried out at constant air pressure and varying times, and the results plotted as shown in Figure 402. Repeating the tests for different air pressure settings will indicate the optimum air pressure and time of exposure.
- (6) Peening intensity must be checked at every change of equipment setting or component and at four hourly intervals.

E. Inspection.

- (1) Visually inspect the treated surface using X5 magnification for uniform coverage and complete overlapping of the bead impressions.

F. Passivation Solution.

CAUTION: USE THIS SOLUTION ONLY WHEN REFERENCED IN A REPAIR CHAPTER.

- (1) The solution, made up in the following proportions should be contained in a stainless steel or polypropylene tank and used at workshop temperature.

Nitric acid (SG 1.42)	28 per cent V/V
Water	72 per cent V/V

REPAIR

72-09-15

Page 405

OVERHAUL

- (2) Fully or partially immerse components in the solution for as long as instructed by the Repair Chapter. On removal from the solution, allow the component to drain then wash thoroughly in clean running water. Dry in a warm oven or with clean warm air.
- (3) Regularly analyse the solution and maintain proportions of water and acid by addition.

G. Parameters for Procedure A (Glass Bead Peening).

Bead Size	0.006-0.010 in. (0,153-0,254 mm) dia.
Working Pressure	65-80 psi (448-551 kPa)
Nozzle Diameter	0.375 in. (9,525 mm)
Nozzle to Work Distance	4-6 in. (100-150 mm)
Angle of Attack	90 deg to component surface
Almen Strip Type	N
Arc Height	0.009 in. (0,228 mm) min. 12 s blasting

COLD ROLL FORMING - REPAIR

1. Application of Cold Roll Forming

A. General.

- (1) The process is used to restore, to acceptable dimensions, oil and air labyrinth seals which have been subjected to rotational rubs, resulting in unacceptable dimensional limits.
- (2) In the case of parallel or thread type seals, parallel floating rollers are used to progressively extrude the existing fin material. The rollers shim-spaced on a mandrel are held in a lathe tool post and the component rotated by the headstock.
- (3) Angled labyrinth fins are axially displaced by a single roller to increase the diametrical measurement.
- (4) Use this repair procedure only when specifically referenced in a Repair Chapter.

CAUTION: FINS MAY BE RESTORED ONCE ONLY BY THIS PROCESS. DO NOT USE THIS PROCESS ON NITRIDE OR CARBONISED SURFACES OR ON FINS PREVIOUSLY REPAIRED BY WELD DEPOSITION.

B. Process Control.

- (1) Degrease the component in accordance with the Repair Chapter.
- (2) Remove any surface treatment from the fins.
- (3) Machine the worn labyrinth fins to the dimensions quoted in the Repair Chapter and ensure all burrs are removed.
- (4) Roll the fins using the appropriate roll forming technique.

PRINTED IN ENGLAND

TN22030

C. Parallel Labyrinth Seals.

- (1) Interpose the largest shim between the rollers then secure the mandrel to the lathe tool post (Ref. Fig.401).

CAUTION: ENSURE ROLLERS ARE SECURED CORRECTLY AND REMAIN SO THROUGHOUT THE ENTIRE OPERATION.

- (2) Position the rollers over the fin. Select the lathe spindle speed, between 7.5 and 12 revolutions per min., and the rolling tool cross feed speed 0.002 in. (0,0508 mm) per component revolution.
- (3) Start the flow of coolant and rotate the component. Feed in the rollers, in increments, to the required depth.

NOTE: Restore each fin in excess of the required dimension and machine back to remove the sharp tip.

- (4) Repeat (2) and (3) until all fins are restored.

NOTE: Further growth can be achieved by progressively reducing the shim thickness and repeating (2) and (3).

D. Thread Type Labyrinth Seals.

- (1) Interpose the largest shim between the rollers then secure the mandrel to the lathe tool post (Ref. Fig.401).

CAUTION: ENSURE ROLLERS ARE SECURED CORRECTLY AND REMAIN SO THROUGHOUT THE ENTIRE OPERATION.

- (2) Adjust the tool angle to suit the helix angle of the seal. Engage the rollers, set to a depth of 0.002 in. (0,0508 mm), at the start of the fin.

CAUTION: ENSURE THE ROLLERS ARE FREE TO TRAVEL ALONG THE MANDREL TO ENCOMPASS THE ENTIRE LENGTH OF THE SEAL.

- (3) Start the flow of coolant and rotate the lathe head-stock by hand, allowing the rollers to be drawn along the mandrel, stop the component before the rollers run off the end of the fin.
- (4) Leave the rollers at depth and reverse the rotation of the component to return the rollers to the fin start. Repeat (3) with a further feed of 0.002 in. (0,0508 mm) on the rollers.
- (5) Repeat (3) and (4) until the fin is of the required size or the rollers are at maximum depth.

NOTE: Restore each fin in excess of the required dimension and machine back to remove the sharp tip.

- (6) Repeat (3), (4) and (5) for each fin start.

NOTE: Further growth can be achieved by progressively reducing the shim thickness and repeating (3), (4) and (5).

E. Angled Labyrinth Seals.

NOTE: Angled fins need not be turned concentric before rolling.

- (1) Position the tool roller in contact with the acute side of the fin (Ref.Fig.402).
- (2) Start the flow of coolant over the work surface and rotate the component at approx. 8 rev per min.
- (3) Feed the roller in at 0.002 in. (0,0508 mm) per component revolution until the fin is of the required size.

ELECTROLESS NICKEL PLATING - REPAIR

1. Electroless Nickel Plating on Aluminium Alloy

A. General.

- (1) This is a plating process suitable for use on aluminium alloys as a wear resistant coating.
- (2) When using this plating process, deposition is approximately 0.0004 in. (0,010 mm) per hour. Build-up thickness should where possible be restricted to 0.004 in. (0,102 mm).
- (3) Alternative proprietary plating solutions to that specified within this process may be used providing they are approved by the engine manufacturer.
- (4) Components to be plated are specified in the appropriate Repair Chapters. Also specified are the plating areas and thicknesses and any necessary pre-plating stress relief and post-plating de-embrittlement heat treatment.

B. Safety Precautions.

- (1) Cyanide salts, solutions and hydrocyanic gas are deadly and extremely rapid poisons, hydrocyanic gas is formed when cyanide comes into contact with acids therefore these should be kept apart.

Poisoning may result from:

- (a) Swallowing cyanide.
- (b) Breathing hydrocyanic gas.
- (c) Absorption through the skin.

PRINTED IN ENGLAND

TN3289

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (d) Warning signs of poisoning are, dizziness, nausea, headache, palpitations, feeling weak, suffocation, tightness of the throat, pallor, deep breathing and unconsciousness.

WARNING: AT ALL TIMES CYANIDE ANTIDOTE MUST BE READILY AVAILABLE. ALL PERSONS WORKING IN THE VICINITY MUST BE THOROUGHLY CONVERSANT WITH THE USE OF THE ANTIDOTE AND FIRST AID PROCEDURES.

- (2) Operators must wear the protective clothing provided.
- (3) Recommended barrier cream shall be applied to the hands and forearms before starting work. Finger nails should be kept short and thorough washing performed before eating, drinking and smoking.
- (4) Smoking and the consumption of food and drink in the facility area are prohibited.
- (5) Cuts and abrasions which appear not to be healing readily must be reported without delay to the Medical Department.
- (6) Materials such as rags and sawdust which have absorbed the solutions must be placed in a container for disposal.
- (7) Cyanide should be stored in a place where it is accessible only to authorised persons.

C. Process Solutions.

- (1) Stripping of nickel from aluminium alloys.
 - (a) The solution is an aqueous solution containing:

Nitric acid (SG 1.42) 50% V/V

The solution may be contained in a stainless steel tank fitted with fume extraction and is used at room temperature.

FN3306

REPAIR
72-09-17

Page 402
Dec 1/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

Ensure no item remains on the component to be treated that can be eroded by the solution. The time of immersion of the component in the solution varies up to 3 min dependent on the thickness of nickel to be removed and the activity of the solution. Then wash in water to remove all traces of the solution.

Replace the solution when no longer effective or on laboratory advice.

(2) Preparation of aluminium alloys.

(a) Cleaning.

Immerse the component for 30 min in a 5 per cent V/V solution of Ardrex 631 at a temperature of 20-50°C. Wash the component in water to remove all traces of solution.

(b) Etching.

The solution is an aqueous solution containing:

Nitric Acid (SG 1.42)	70% V/V
Hydrofluoric Acid (60% W/W)	10% V/V

Etch the component for a period of up to 2 min in the solution then wash in water to remove all traces of the solution.

(c) Zincating.

The solution may be made up by dissolving 80.08 oz of sodium hydroxide in one gallon of cold water and further dissolving 16.016 oz of zinc oxide while the solution is still warm or 500 g of sodium hydroxide one litre of water and 100 g of zinc oxide. Each component shall be immersed for 2 min in the solution at room temperature. When a double zincate process is required the initial zincate layer is removed by immersing the component for ½ min in a cold 50 per cent V/V aqueous solution of nitric acid (SG 1.42) followed by a water wash to remove the solution and then repeating the zincating process.

OLYMPUS 593

MK.610-14-28
OVERHAUL

When the zincating process is complete water wash the component and transfer to the electroless nickel plating solution.

- (d) Stripping solution (double zincate only).

The solution is an aqueous solution containing:

Nitric acid (SG 1.42) 50% V/V

The solution may be contained in a stainless steel tank fitted with fume extraction and is used at room temperature.

Strip the zincate from the component for a period of 30 secs in the solution then wash in water to remove all traces of the solution.

- (e) Regularly analyse the solutions and replace on laboratory instructions.

- (3) Electroless nickel plating.

- (a) Solution.

Are of the proprietary type as supplied by Messrs. M.L. Alkan, W. Canning, Shipley Chemical or Imasa Limited. Solutions are to be approved by and maintained by the local controlling laboratory in accordance with the manufacturers instructions.

- (b) Container.

The working solution is contained in a stainless steel tank made from material to British Standard EN58H or J and may be internally coated with polytetrafluoroethylene, PTFE. A coating thickness of 0.002 in. retards the deposition of nickel and is reasonably resistant to mechanical damage. A chemically inert coating may be used on tank sides subject to engine manufacturer approval. To aid plating and prevent damage to the tank coating plastic bags may be immersed in the solution in which to suspend the component.

FN5708

**OLYMPUS 593**MK.610-14-28
OVERHAUL

It is preferable to provide a duplicate tank and in addition a plastic storage vessel large enough for the solution. After a period of operation electroless nickel plate deposits on the tank lining and gassing occurs around the tank sides. The solution should then be transferred to a plastic storage vessel and the tank stripped of nickel using a 30% V/V nitric acid solution.

(c) Plating.

Immerse the component in the plating solution for the period of time to give the required thickness of plating. A means of mechanical agitation shall be provided, slight air agitation not sufficient to cool the plating solution is advisable. The solution is to be heated by means of an external water jacket around the tank and is to be maintained between 75 to 80 deg C. Filtration of the solution using a "non-metal" type filter is advisable as the nickel comes out of solution and floats on the surface of the solution gradually increasing in size.

(4) Masking.

- (a) Where necessary components shall be masked with a medium approved by the engine manufacturer (Turco 522 masking and 526 stop off). Use Turco 622 for removal of the masking.
- (b) Degrease the component (Ref.Repair, 72-09-00, Cleaning).
- (c) Attach aluminium wire to the component to suspend them in the tanks.

CAUTION: ONLY USE ALUMINIUM WIRE TO SUSPEND COMPONENTS IN PROCESS TANKS.

PRINTED IN ENGLAND

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (d) Cover oil ducts and holes with a suitable masking tape.
- (e) Apply masking.
- (f) Before masking has hardened cut away the area to be nickel plated.
- (g) Air dry for 6 hours.

D. Stripping Existing Plating.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning).
- (2) Immerse the component into the stripping solution.
- (3) Rinse in clean cold running water and dry after immersion in hot water.
- (4) Unless the component is to be re-plated immediately apply the approved de-watering oil/lanoline or approved temporary anti-corrosive protection.

E. Preparation (Double Zincate).

- (1) Attach aluminium wire to the components.
- (2) Degrease the component (Ref.72-09-00 Cleaning).
- (3) Mask off the areas not to be plated using a suitable masking medium.
- (4) Prepare the face/area to be plated (Ref. para.C.(2)(a)).
- (5) Wash in cold running water.
- (6) Etch in the nitric/hydrofluoric acid solution.
- (7) Wash in cold running water.
- (8) Zincate dip for 2 min.
- (9) Wash in cold running water.

TN4926

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (10) Strip in nitric acid solution.
- (11) Wash in cold running water.
- (12) Zincate dip for 2 min.
- (13) Wash in cold running water.
- (14) Repeat wash in cold running water in a clean tank.

NOTE: To single zincate omit para.10, 11, 12, 13.

F. Electroless Nickel Plating.

- (1) Immediately after etching and preparation proceed with the plating.
- (2) Wash the component in clean, cold running water.
- (3) Immerse in a clean hot water preheat tank (75 to 80 deg C).
- (4) Immerse in the plating solution until the required thickness of deposit is obtained.
- (5) Wash in cold running water.
- (6) Components not requiring further wet processing shall be rinsed in clean hot water and dried.
- (7) Remove all traces of masking.
- (8) Apply the approved temporary anti-corrosive protection.

G. Inspection After Plating.

- (1) Vapour degrease the component (Ref.72-09-00 Cleaning).
- (2) Visually examine the component to ensure that the electroless nickel plate is continuous, adherent, free from blistering, flaking and excessive roughness and only those areas specified on the drawing are plated.

DRY FILM LUBRICANT - REPAIR

1. Dry Film Lubricant

A. General.

- (1) This covers the application of graphite dry film lubricant to substrate materials of steel and aluminium alloy. The lubricant is applied as a thin film and used to inhibit wear and fretting.
- (2) The compound must not be applied to components of a liquid oxygen system.
- (3) The maximum operating temperature of the dry graphite lubricant is 400 deg C in oxidising conditions and 500 deg C in non-oxidising conditions.

Graphite PL239 Vendor Code K1270 (MSRR 9276)

Thinner SV.16/R1 Vendor Code K1270

NOTE: Shelf life of compound in original sealed containers is 12 months at room temperature.

B. Safety Precautions.

- (1) The compound as supplied and when thinned contains flammable solvents. Therefore, fire precautions must be observed for the storage and usage of the compound and thinner.
- (2) The compound should only be applied in a well ventilated area preferably in a spray booth.
- (3) The Safety Officer shall be informed wherever these materials are used.

C. Stripping.

Coatings which have not been oven cured may be stripped by treatment with the appropriate thinners.

Coatings which have been oven cured may be stripped in accordance with cleaning procedures (Ref.72-09-00 Cleaning para.4.D.).

PRINTED IN ENGLAND

OLYMPUS 593
MK.610-14-28
OVERHAUL

D. Preparation of Surfaces.

- (1) Fill any holes in the component with hard wax, and using a suitable masking tape, mask the areas which are not to be abrasively blasted.
- (2) Wet abrasive blast aluminium alloy and steel using 320/400 mesh aluminium oxide grit.

NOTE: In some instances abrasive blasting is unacceptable and alternative procedures will be specified in the Repair Chapter.

- (3) Remove the masking tape.
- (4) Remove the wax by immersion in hot trichlorethylene liquid.
- (5) Vapour degrease (Ref.72-09-00 Cleaning).

NOTE: After degreasing handle the components with care in order to avoid contamination of the surfaces to be coated. If necessary the relevant surfaces should be locally degreased using a liquid degreasant and clean, dry lint free cloth (Ref.72-09-00 Cleaning). After degreasing allow the component to dry thoroughly.

- (6) Mask off the areas not to be treated using jigs, plates, plugs and/or masking tape.

E. Application of Lubricant.

- (1) Mix the lubricant thoroughly before use and use in the as received condition unless otherwise stated.
- (2) The lubricant shall be applied by spraying, brushing or dipping to achieve a dry film thickness between 0.0001 in. and 0.0003 in. (0,003 mm and 0,008 mm) unless otherwise specified.
- (3) Air dry the component for 10 min. minimum.
- (4) Remove the masking.

REPAIR

MK. 610-14-28

OVERHAUL

- (5) Stove the component at $190 \pm 5^{\circ}\text{C}$ for 2 hours.
- (6) Burnishing of the stoved coating may be carried out using clean paper.

F. Touch-up.

- (1) Touch-up may be carried out in approved cases by applying the appropriate compound by brushing followed by air drying and if possible by oven curing.

G. Inspection.

- (1) Ensure the coating is uniform in colour, smooth, adherent and free from flaking and cracking. Faulty coatings may be touched-up or if necessary stripped off and the parts recoated.

ANODIZING OF ALUMINIUM ALLOYS - REPAIR

1. Anodic Treatment

A. General.

(1) Repair of damaged anodic films.

- (a) The controlling laboratory should be consulted prior to commencing repair of the anodic film on components which have been machined or damaged.
- (b) Two processes are recommended. The chromic acid process yields a film thickness of approximately 0.00012 in. (0,003 mm) and the sulphuric acid process yields a film thickness of between 0.0003 in. and 0,0005 in. (0,008 and 0,013 mm). Approximately half the film thickness is material growth and the remainder is penetration.
- (c) Chemical conversion solutions may be utilised to give corrosion protection to small areas of damage. These solutions produce a corrosive resistant film of minimal thickness and all cases of doubt should be referred to the Controlling Laboratory (Ref.72-09-02 Alocrom 1200).
- (d) Stripping and re-anodizing results in a size loss over the surface of 0.00012 in. (0,003 mm) maximum for chromic acid and 0.0003 in. (0,008 mm) maximum for sulphuric acid films.
- (e) It is permissible to re-anodize components (chromic acid process only) without stripping the existing anodic film by re-establishing electrical contact on the component and re-processing in accordance with the relevant procedure.
- (f) Components to which an organic finish has been applied or to which dissimilar materials are assembled, must be adequately protected before re-anodizing.

REPAIR

72-09-19

Page 401

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (g) Castings containing alloying elements such as copper, nickel and iron in excess of seven per cent (total) or more than five per cent copper, are not suitable for treatment by the chromic acid process.

B. Safety Precautions.

- (1) An effective fume extraction system.
- (2) Operators must wear the protective clothing provided.
- (3) Recommended barrier cream shall be applied to the hands and forearms before starting work. Fingernails should be kept short and thorough washing performed before eating, drinking and smoking.
- (4) Smoking and the consumption of food and drink in the work area is prohibited.
- (5) Cuts and abrasions which appear not to be healing readily must be reported without delay to the Medical Department.
- (6) Materials such as rags and sawdust which have absorbed the solutions must be placed in a container for disposal.

C. Process Solutions.

- (1) Chromic acid solution.

The solution is an aqueous solution containing:

Free Chromic Acid	30 to 50 g/l
Chloride (as NaCl)	0,2 g/l maximum
Sulphate (as Na ₂ SO ₄)	0,5 g/l maximum

To make up one litre of the solution, dissolve 40 grams of chromic acid (CrO₃) in 500 ml of water and make up to one litre by adding water. The purity of the chromic acid must not be less than 99.5 per cent CrO₃ and the water of suitable purity.

REPAIR
72-09-19

Page 402

OVERHAUL

The solution may be contained in a mild steel tank fitted with a suitable rectifier, extraction, heating and cooling coils or jackets, and solution agitation. The temperature shall normally be controlled uniformly in the range 38 deg C to 42 deg C unless otherwise stated. Agitate by clean compressed air to ensure uniformity of solution temperature.

The cathode shall be mild steel or stainless steel in the form of plates or the tank itself.

The anode:cathode area ratio is not critical but generally a ratio of 5:1 to 10:1 is suitable. Less chromic acid is consumed at the higher ratio.

Additions of chromic acid may be made provided the limits are maintained and the total chromium (estimated as CrO_3) does not exceed 100 g/l. When this chromium level is reached, the solution shall be discarded.

(2) Sulphuric acid solution.

The solution is an aqueous solution:

Sulphuric acid 90 to 400 g/l

The solution may be contained in a mild steel tank lined with lead sheet and fitted with a suitable rectifier, extraction, air agitation, heating and cooling coils or jackets. The solution temperature must be maintained within the range indicated in Figure 401.

The cathode shall be lead sheet and normally this will be the lining of the tank. Auxiliary cathode rails should be provided so that additional cathodes may be used if required.

The solution shall be analysed regularly by the local Controlling Laboratory to ensure that the electrolyte is maintained within the following:

Free Sulphuric acid 90 to 400 g/l

OLYMPUS 593

MK.610-14-28
OVERHAUL

The solution should be maintained within ± 10 per cent of the strength decided upon.

Chloride (as NaCl) 0,2 g/l maximum

Dissolved aluminium within the limits indicated in Figure 401.

(3) Stripping solution.

The solution is an aqueous solution containing:

Chromic Acid CrO_3 - 7,5 g/l

Phosphoric Acid H_3PO_4 - 8,0 g/l

This solution should be operated at 90 to 100 deg C and contained in a stainless steel tank fitted with fume extraction.

The maintenance of the solution shall be the responsibility of the local Controlling Laboratory who will analyse the solution weekly.

Chromic Acid CrO_3 - 7,5 to 10,0 g/l

Phosphoric Acid H_3PO_4 - 8,0 to 12,0 g/l

Chloride NaCl - 0,2 g/l max.

As a guide the solution is satisfactory if it is red in colour, as the colour changes from red the solution shall be rejected.

(4) Dichromate sealing solution.

This is an aqueous solution containing:

Potassium Dichromate 40 to 60 g/l
 $\text{K}_2\text{Cr}_2\text{O}_7$

The solution may be contained in a mild steel tank fitted with a suitable means of heating to maintain a temperature between 96 deg C and 100 deg C. The tank must have an effective fume extraction system fitted.

The solution shall be analysed and maintained with suitable additions of potassium dichromate by the local Controlling Laboratory. Alternative solutions may be used with the agreement of the Controlling Laboratory.

D. Preparation.

- (1) Wash, if necessary, in paraffin to remove general grit.
- (2) Make electrical contact using pure aluminium wire, or a clean jig, either of which must be adequate to carry the current.
- (3) Degrease the assembly (Ref.72-09-00 Cleaning).
- (4) Mask off areas not to be stripped or anodized with a stopping-off lacquer approved by the local Controlling Laboratory.

E. Stripping Anodic Film.

- (1) Carry out cleaning and preparation (ref.para.D).
- (2) Immerse the component in the stripping solution for 10 to 20 mins.
- (3) Wash thoroughly in clean, cold running water.

F. Anodizing (Chromic Acid).

- (1) Carry out cleaning and preparation (Ref.para.D).
- (2) Immerse the component in the chromic acid electrolyte, ensuring uniform temperature by agitation of electrolyte.
- (3) Connect the jig or aluminium wire securely to the anode bar.
- (4) If the component contains alloying elements approaching the maximum permissible (Ref.paragraph 1.A.(1)(g)) disregard the procedure of paragraph (5) and continue with the procedure of paragraph (6).

- (5) Voltage control - general procedure.

NOTE: The times quoted in the following procedure are the minimum to be applied.

- (a) Raise the voltage in steps of 5 volts (maximum) to 40 volts during the first 10 minutes.
- (b) Maintain at 40 volts for 20 minutes.
- (c) Gradually raise voltage from 40 to 50 during the next five minutes and maintain at 50 volts for five minutes.
- (d) Reduce voltage to zero over the next minute.

- (6) Voltage control when alloying elements are approaching maximum permissible.

NOTE: The times quoted in the following procedure are the minimum to be applied.

- (a) With the electrolyte temperature at 25 to 35 deg C, gradually raise the voltage in steps of 5 volts (maximum) to 40 volts during the first 10 minutes.
- (b) Maintain at 40 volts for 30 minutes.
- (c) Reduce voltage to zero over the next minute.

- (7) Remove the component from the electrolyte and drain rapidly.

- (8) Wash in water.

- (9) Wash in clean, hot water (80 deg C minimum) and remove and dry with clean, dry, compressed air.

NOTE: Castings of high porosity may require prolonged immersion in clean cold water, or in hot water (80 deg C minimum) for up to 1 hour to ensure complete removal of the electrolyte. When sealing is required, the water immersion shall be at 80 deg C minimum for 30 minutes.

G. Anodizing (Sulphuric Acid).

(1) Operating voltage.

(a) To obtain the operating voltage, suspend in the electrolyte from the anode bar, a sheet of 99% pure aluminium of such size that it requires a current density of at least 10 per cent of the normal electrical load of the bath. Adjust the temperature, the maximum value of which must be in accordance with the strength of the acid (Ref. para. C. (2)). Switch on the current and adjust the voltage to give an anode current density between 9.04 A/sq. ft to 14.77 a/sq. ft (100 to 160 A/sq. m), note the voltage. This will be the operating voltage used.

(2) Carry out cleaning and preparation (Ref. para. D).

(3) Immerse the component in the sulphuric electrolyte and position it to prevent the formation of air locks. Agitate the electrolyte to ensure uniformity of solution temperature.

(4) Connect the jig or aluminium wire securely to the anode bar.

(5) Raise the current density between 9.04 A/sq. ft to 14.77 A/sq. ft (100 to 160 A/sq. m) for a period of 20 to 30 minutes.

(6) Switch off the current.

(7) Remove the component from the electrolyte, drain quickly and wash thoroughly in clean cold running water.

(8) Seal the component if required using method (a) or (b):

(a) Immerse in clean water at 80 deg C for a minimum period of 30 minutes, remove and assist drying by using a clean, dry, air blast.

- (b) Immerse the component in potassium dichromate sealing solution (Ref.paragraph C.(4)) for 20 minutes. Wash the component thoroughly in clean, cold running water to ensure cleanliness, immerse in boiling water then assist drying by using a clean, dry, air blast.

H. Inspection of Anodic Film.

- (1) Visually inspect the component coating which should be grey in colour, uniform and continuous, unless dichromate sealing has been carried out, when the component will have an even yellow appearance.
- (2) Low voltage electrical tests may be utilised to assess the continuity of the anodic film.
- (3) The average thickness of the coating may be determined by a laboratory approved method.
 - (a) Sulphuric acid anodic film 0.0003 in. to 0.0005 in. (0,008 mm to 0,013 mm) in thickness.
- (4) Components which have been stripped and re-anodized shall be inspected to ensure that intergranular attack has not occurred.

TEMPORARY PROTECTION OF METAL PARTS AGAINST CORROSION

1. General

Temporary protection against corrosion is given to certain components during processing if, for any reason, they have to wait for a successive operation whilst they are either stripped of their normal protective finish, or have such finishes in an inferior condition.

As a general rule components made in nickel base alloys, austenitic steels and titanium, which are normally unprotected in service, need not be treated.

The danger of corrosion of any surface is dependent upon the condition of that surface and the surrounding atmosphere. Therefore, as components which have been chemically cleaned are extremely prone to corrosion and as it is usually difficult to know exactly the duration of any delay, a safe rule is to apply protection when there is to be any delay at all.

Magnesium components should never stand without protection; therefore, immediately their protection has been removed, temporary protection should be applied.

When components have been properly treated by temporary protection materials they can stand for any period up to 500 hours in normal dry storage conditions.

Alternative solutions to those specified within this process may be used providing they are approved by the engine manufacturer. Use the appropriate dewatering fluid for the type of metal or alloy to be protected.

2. Materials

A. Container.

- (1) Cold dewatering fluid should be contained in a conical tank, or in a tank with a sump and drain, water will then drain to the bottom of the tank and may be drawn off when necessary.

B. Protective Materials.

(1) Dewatering fluids (General).

- (a) Dewatering fluids are used at room temperature and as supplied.
- (b) Components which have been treated with these fluids are covered by a film of oil and may be handled at the inspection stage without degreasing.
- (c) The dewatering fluid must be checked frequently for inorganic acidity and viscosity, the period between the checks depends upon the amount of work done.
- (d) Dewatering fluid - Ardrex 3961 - Vendor K6858.
Dewatering fluid - Rustilo DW904 - Vendor K2967
*Dewatering fluid - Rustilo DWX21 - Vendor K2967

*This will replace DW904.

(2) Lanolin/White Spirit to DEF2331-A.

- (a) Lanolin temporary protective, used as supplied, to protect the component.

NOTE: Components treated with this material should not be exposed to hot sunlight or stored near hot radiators as the protecting film will melt.

3. Processing

A. Apply the Protective.

NOTE: Components can be immersed into dewatering fluid directly following wet processing, i.e. after water washing.

- (1) Wash the component in clean kerosine or white spirit and allow to drain.
- (2) Immerse the components in a temporary protective ensuring that all surfaces are covered.

NOTE: Components of intricate shape should have their position changed several times during immersion to ensure that the protective enters all holes and cavities.

- (3) Remove the component from the protective and allow to drain.

B. Remove the Protective.

- (1) Wash the components thoroughly in either kerosine or white spirit.
- (2) Degrease if necessary (Ref.72-09-00 Cleaning).

MACHINING OF ADJUSTING WASHERS, SHIMS ETC - REPAIR

1. General

- A. This chapter details the necessary steps of procedure to reduce the thickness of adjusting washers, shims etc., to suit assembly dimensions. In addition to the washers listed in the IPC (Illustrated Parts Catalogue) Chapter 72-00-00 this chapter includes machining details for components listed within 73-00-00, 74-00-00, 76-00-00 and 79-00-00.
- B. Figures are arranged in IPC chapter and section order, each component size referenced by IPC figure and item number.
- C. Machine only to the dimensions quoted in the tables and re-part number the component accordingly. All stages of work must be inspected and signed for by a qualified inspector.

MACHINING INSTRUCTIONS

1. Locate to magnetic table.
2. Finish grind an equal amount from both sides to achieve required dimension A.
3. Finish grind chamfer both sides of bore.
4. Remove sharp edges.
5. Inspect surface finish (Ref.72-09-00 Repair).
6. Subject to magnetic particle crack detection (Ref.Fig.445).
7. Line through old part number.
8. Re-part number (Ref.72-09-00 Repair para.3.E. or D.).

1-65	0.174 (4,42)	1-95	0.192 (4,88)

MACHINING INSTRUCTIONS

1. Locate to magnetic table.
2. Finish grind to achieve required dimension 'A'.
3. Dimensionally inspect depth of remaining chamfer.
4. If necessary mount on lathe and reproduce chamfer.
5. Remove sharp edges.
6. Inspect surface finish (Ref. 72-09-00 Repair).
7. Subject to magnetic particle crack detection (Ref. TSD594, 0P201).
8. Re-partnumber (Ref. 72-09-00 Repair para.3.D.).

1-40	0.085 (2,16)	1-50	0.135 (3,43)
1-45	0.110 (2,79)	1-55	0.160 (4,06)

MACHINING INSTRUCTIONS

1. Locate to magnetic table.
2. Finish grind an equal amount from both sides to achieve required dimension A.
3. Locate in soft jawed chuck, machine chamfer both sides of outside diameter.
4. Remove sharp edges.
5. Inspect surface finish (Ref.72-09-00 Repair).
6. Stress relieve by heating to 150 deg.C. for one hour, cool in air.
7. Subject to magnetic particle crack detection (Ref.Fig.449).
8. Etch, then inspect for grinding burns (Ref.72-09-14 Repair).
9. Line through old part number.
10. Re-part number (Ref.72-09-00 Repair para.3.E. or D.).

RECTIFICATION OF MINOR DAMAGE - REPAIR

1. General

This procedure details the rectification of minor damage to surfaces or bolt-holes of components that have been rejected by Inspection/Check as 'Accept after Repair'.

2. Identification of Type of Damage

- A. Table 401 defines the inspection terminology used to identify the type of damage sustained by the component.
- B. Determine the rectification to be carried out for the type of damage sustained as detailed in para.3.

TERM	MEANING
Bend	Distortion at the edge of sheet material in a direction normal to the surface
Brinelling	Surface indentation of ball or roller track bearing surfaces, usually caused by repeated shock loading by the balls or rollers
Burr	Lip formed around a defect by displaced metal
Crack	Metal parted without deformation, usually caused by fatigue
Dent	Smooth depression in sheet material
Erosion	Progressive removal of the surface, caused by impact of fine abrasive particles
Flaking	Partial or complete removal of surface coating
Fretting	Wear caused by unintentional movement between abutting faces

Inspection Terminology
Table 401 (Continued)

TERM	MEANING
Gouge	Long, heavy depression with material removed, caused by impact with a foreign object
Inclusion	Foreign matter embodied in the base material during manufacture
Nick	Sharp surface indentation caused by impact with a foreign object
Peeling	Partial or complete separation of surface layer
Pick-up	Transfer of metal to a bearing surface, usually caused by insufficient lubrication
Pitting	Surface depression, usually caused by corrosion, chipping or electrical discharge
Plucking	Transfer of metal from a bearing surface, usually caused by insufficient lubrication
Puncture	Hole in sheet material or tube, caused by impact with a foreign object or by fretting
Score	Deep scratch
Scratch	Light, narrow, shallow mark with material displaced, caused by impact with a foreign object.
Scuff	Mark caused by sliding contact between smooth surfaces
Spalling	Sharply roughened area of progressive chipping on ball or roller track bearing surfaces, caused by loading of cracks or inclusions.
Tear	Metal parted and deformed, usually caused by impact with a foreign object at the edge of the component

3. Rectification of Damage

A. Procedures for Rectification of Surface Damage.

- (1) Refer to Table 402 for the rectification required for the type of damage, and rectify in accordance with the following.

Rectification A - Remove damage by stoning and/or light hand polishing.

Rectification B - Remove high spots by stoning and/or light hand polishing.

Rectification C - Relieve by light blending, stoning and/or light hand polishing.

B. Procedure for Rectification of Elongated Bolt-holes.

- (1) Remove sharp corners, and, where a chamfer has been removed, restore the chamfer by stoning and hand polishing.

RECTIFICATION REQUIRED (REF.PARA.3.)

TYPE OF DAMAGE (REF. TABLE 401)	DAMAGE ABOVE NORMAL SURFACE CONTOUR	DAMAGE BELOW NORMAL SURFACE CONTOUR

C. Hand Tools.

CAUTION: LOAD/PRESSURE APPLIED WHEN USING THE FOLLOWING EQUIPMENT MUST NOT BE SUFFICIENTLY GREAT SO AS TO PRODUCE SMOKING AND/OR AN UNPLEASANT ODOUR FROM THE ADHESIVE AGENT IN THE ABRASIVE WHEEL.

(1) The definition of the term "hand tools only" is deemed to imply that the following may be used:

(a) GUN - USHIO AIR TOOL COMPANY LTD.

Type MSG-3BSN
65000 R.P.M.
(6 bar air pressure)

(b) WHEEL - MASTER ABRASIVE

Type A120HFX

4. Procedure on Completion of Rectification

- A. On completion of the rectification, refer to the relevant Fits and Clearances Chapter to ensure no dimension has been violated, then refer to the relevant Repair Chapter, and, if required, apply local touch up procedures on finishes.
- B. When rectification is complete, having dressed the component, carried out any protective finish required, and having confirmed that no dimension or other mandatory requirement has been violated, return the component to Inspection/Check for final clearance.

ELECTRICAL DISCHARGE MACHINING - REPAIR

1. Application of Electrical Discharge Machining

A. General.

- (1) Electrical discharge machining (EDM), sometimes referred to as spark erosion, is a method of material removal and may be used on all electrically conductive materials. Metal is eroded as a result of energy released by a continuous succession of spark discharges between a preformed electrode and the workpiece whilst both are immersed in a heated dielectric liquid.
- (2) Roughing out operations, precise drilling of holes or complex shaping may be carried out at greater speed and economy than conventional machining. Stress and distortion, usually encountered when performing similar operations by conventional machining are also eliminated. There is however, a disadvantage in that EDM produces a contaminated surface layer of material which is non-structural and whose properties are dissimilar to those of the parent material. Abrasive blasting or other processing may be necessary to remove this surface layer from the machined surface.

B. Safety Precautions.

- (1) Both operator and supervisor must be fully conversant with the use of carbon dioxide fire extinguishers and observe strict fire precautions in the vicinity of EDM machines at all times.
- (2) Dielectric liquids are flammable and the operating temperatures must be strictly observed. A thermostat control must be fitted to the work tank which will automatically switch OFF the heater should the temperature of the dielectric approach 15 deg C of its flash point.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (3) Minimum levels of dielectric above the spark gap must be maintained and the electrical supply must be switched OFF before any adjustment is made to electrode or workpiece.
- (4) Regular maintenance of equipment and cleaning of dielectric filter elements are essential to prevent dielectric spillage.
- (5) In the event of fire, the electrical supply to the machine and, if incorporated, fume extractor must be switched OFF, and the fire extinguished with a carbon dioxide fire extinguisher.
- (6) Whenever the machine is not in use, the dielectric liquid must be drained from the work tank into the machine tank or a covered container.

C. Dielectric Liquids.

- (1) Dielectric liquids must be non-toxic, resist fuming and act as an insulator until the spark is initiated, and then act as a good conductor, reverting to insulator when electrical discharge is complete. The liquid must also flush eroded particles from the spark gap.
- (2) Preferred dielectrics are listed in Table 401, and the minimum heights of the dielectric above the spark gap are listed in Table 402.

0 - 5	1.0 in. (25 mm)

Minimum Height of Dielectric
Above Spark Gap
Table 402

D. Electrodes.

- (1) The main electrode materials in general use are, copper, graphite, brass, thoriated tungsten and copper/tungsten alloy.

REPAIR

72-09-23

Page 403

Aug 1/77

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Copper/tungsten alloy electrodes must always be used when high accuracy and good surface finish are required, whilst thoriated tungsten, in wire form, is commonly used for drilling blade cooling holes. The other three materials are generally used for roughing operations when a high metal removal rate is required, but with the attendant disadvantage of high electrode wear and a rough surface finish.

E. Process Control.

- (1) Each component will be the subject of specific equipment settings, the settings will be tabulated in the relevant Repair Chapter.
- (2) In cases involving highly stressed or critical components, it is recommended that a test piece is machined to determine electrode size and spark gap allowance. The spark gap which is dependent on the power setting, can vary between 0.0004 in. and 0.012 in. (0,01 and 0,31 mm).
- (3) When components require a post EDM process (i.e. abrasive blasting), to remove contaminated surface layers, the method and parameters will be specified in the relevant Repair Chapter.

DRY ABRASIVE BLASTING - REPAIR

1. Application of Dry Abrasive Blasting

A. General.

- (1) The dry abrasive blasting process is used for cleaning surfaces, as a preparation for further processing, or it may also be used on metallic parts to improve fatigue strength by producing a uniform matt, non-directional surface texture.
- (2) A standard abrasive blast cabinet with automatic timing device must be used.
- (3) This process must only be used when specifically referenced in a Repair Chapter or in a Service Bulletin. Operating parameters for the normal blasting procedure are tabulated in para.H.

NOTE: Dry abrasive blasting is not recommended for titanium or magnesium alloys. If this process is used, the fine metallic powder produced must be scrubbed through a cyclone water system, e.g. Sturtevant equipment, and precautions taken against fire hazards in the cabinet.

B. Safety Precautions.

- (1) All apparatus must be earthed to ensure dispersion of any heavy charge which might be generated during the process.
- (2) Cabinets must be fitted with explosion doors and continuous low speed air extraction.
- (3) A face mask and rubber protective gloves must be worn by the operator during blasting and when cleaning the exhaust filters.

C. Abrasive.

- (1) Aluminium oxide grit must be lead free virgin fused alumina containing less than 5 ppm elemental lead and less than 20 ppm total lead compounds. The iron content, as acid extractable iron, must be less than 1 per cent ww.

REPAIR

72-09-24

Page 401

Nov 1/78

OLYMPUS 593

MK.610-14-28
OVERHAUL

D. Process Control.

NOTE: It is recommended that separate blasting cabinets are used for the treatment of steels and light alloys to minimise damage to components from metallic contamination.

- (1) Examine the abrasive and ensure that it is not contaminated by excess metallic iron or lead (Ref. para.C.).
- (2) The component must be dry and free from grease, or degreased in accordance with the Repair Chapter or Service Bulletin.
- (3) Component surface areas which do not require blasting must be protected by suitable masks or blanks, or as specified in the Repair Chapter or Service Bulletin.
- (4) Before blasting any component ensure the blast intensity is correct (Ref. para.E.).
- (5) Place and secure the component in the appropriate blast cabinet for steels or light alloys and, ensure that the nozzle size is correct and the cabinet filled with correct grit type and size.
- (6) Operate the machine at the correct air pressure and holding the nozzle the correct distance from the surface to be treated, blast the component as required to remove all traces of scale or stains, and/or to produce an even coloured uniform matt surface.
- (7) After blasting, all traces of dust or grit must be removed from the surface by means of a soft brush or a clean dry air blast. In certain cases, e.g. prior to bonding, a vacuum assisted brush should be used to ensure complete removal of particles.
- (8) The handling of treated areas of components must be reduced to a minimum. It may be necessary to use rubber gloves and store small items in polythene bags to prevent contamination.

NOTE: Steel and light alloy parts not requiring immediate further processing or final protection treatment should be dipped in a temporary protective (Ref.Repair 72-09-20).

OVERHAUL

- (9) If specified by the Repair Chapter or Service Bulletin, passivate stainless steels and nickel base alloy component (Ref.para.G.).

E. Blast Intensity.

NOTE: The blast intensity check is not normally required when dry abrasive blasting is used for cleaning, but must be carried out when blasting is used to improve the fatigue strength of a component.

- (1) Blast intensity is monitored by using an appropriate Almen test strip (Ref.Fig.401) as specified in para.H.
- (2) The test strip must be held flat in a fixture and blasted, ensuring uniform coverage of the exposed surface, under the same parameters as the component it represents.
- (3) After removal from the fixture, the test strip will assume an upward curve. The amount of deflection from the flat or 'arc height' must be measured after blasting to ensure equipment settings and operation are correct.
- (4) Blast intensity must be checked at every change of equipment setting or component, and daily during continuous operation.

F. Inspection.

- (1) Visually inspect the treated areas to ensure the surface shows uniform matt finish.

G. Passivation Solution.

CAUTION: USE THIS SOLUTION ONLY WHEN REFERENCED IN A REPAIR CHAPTER OR SERVICE BULLETIN.

- (1) The solution, made up in the following proportions should be contained in a stainless steel or polypropylene tank and used at workshop temperature.

Nitric acid (SG 1.42)	30 per cent V/V
Water	70 per cent V/V

- (2) Fully or partially immerse components in the solution for as long as instructed by the Repair Chapter or Service Bulletin. On removal from the solution, allow the component to drain then wash thoroughly in clean running water. Dry in a warm oven (max. temp.100 deg C) or from immersion in boiling water. Clean, dry compressed air may be used to assist drying.

TN43004

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Regularly analyse the solution and maintain the proportions of water or acid by addition.

H. Parameters for Normal Dry Abrasive Blasting.

Blasting Medium	120-220 mesh Bauxilite (Aluminium oxide) grit
Working Pressure	20-30 psi (138-207 kPa)
Nozzle Diameter	0.375 in. (9,5 mm)
Nozzle to Work Distance	5-8 in. (125-200 mm)
Angle of Attack	90 deg. to component surface
*Almen Strip Type	N
*Arc Height	0.002-0.005 in. (0,0508-0,130 mm) after 12 s uniform blast
*Required only when checking the blast intensity.

OVERHAUL

REMOVAL OF COMBUSTION/PLASMA/DETONATION COATINGS

1. Removing Coatings

A. General.

- (1) This standard practice details the chemical and mechanical methods for stripping combustion, plasma flame and detonation deposited coatings from engine parts.
- (2) The compatibility of the method of stripping and the engine part base material has been taken into account.
- (3) On certain steel base materials where hydrogen is evolved during the coating removal process, stress relief and de-embrittlement is required.

B. Safety Precautions.

- (1) Under certain circumstances some of the chemicals and processes referred to in this standard practice may be hazardous to health and/or safety. Before carrying out any of the detailed processes initially, those responsible shall consult their supervision in regard to the safe working practices to be adopted. Nothing in this standard practice shall relieve an operator of his responsibility in respect of the provisions of safe working methods and the safety of his operators.

C. Condition of Parts.

- (1) Parts must be free from oil, grease or any other contaminant, particularly in the area of the coating to be removed.
- (2) Parts shall be degreased to the relevant specification prior to removal of coating.
- (3) Parts which cannot be cleaned as in para.(2), e.g. painted parts, shall be completely stripped of paint if required to allow process to be carried out. This shall be carried out to the relevant specification or mechanically.

REPAIR

72-09-25

Page 401

Sep 1/80

OLYMPUS 593
MK.610-14-28
OVERHAUL

D. Stress Relief.

- (1) When instructed in the repair, heat treat to stress relieve the component as follows:
 - (a) Heat treat to the temperature quoted for the required amount of time.
 - (b) The heat treatment controlled time shall commence when the parts have reached the specified temperature.

E. Tooling.

- (1) Parts which are in a condition ready for coating removal, excepting blasting to process K, shall be held by tooling or in a wire basket or by a hook.
- (2) Where electrolytic stripping is employed (process E and F) the parts shall be wired up in anodic polarity.
- (3) Tooling or masks shall be chosen which are not attacked by the stripping solution or which alternatively may be masked off prior to stripping.

F. Masking.

- (1) Stopping off is required where there is a possibility of attack to an area other than where the coating is to be stripped.
- (2) Masking may be carried out using suitable wax, tapes, plugs and lacquers. Contact the controlling laboratory when advice is needed.

G. Washing and Drying.

- (1) Parts which have been chemically processed to strip coating shall be thoroughly water washed/water air blasted and bristle brushed as required to remove any remaining loose coating deposits and to wash away any chemical substances.
- (2) All masking and tooling shall be removed.

TN2607

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (3) Parts shall be hot water washed and dried off from immersion in clean hot water at 80°C minimum.

H. De-embrittlement (When Required).

- (1) Parts that have been subjected to stress relief shall be given a de-embrittlement heat treatment not more than 16 hours after processing, and preferably as soon as possible.
- (2) Heat treat to the temperature quoted in the repair for the required amount of time.
- (3) The heat treatment controlled time shall commence when the parts have reached the specific temperature.

J. Inspection.

- (1) Parts if necessary shall be degreased to the relevant specification (not aluminium components).
- (2) Parts shall be inspected to ensure the coating has been completely removed.
- (3) If coating is still in evidence the parts must be recycled. The advice of the local controlling laboratory should be sought before proceeding.
- (4) Parts shall be examined for incidental damage which has been incurred during process.

K. Corrosion Prevention.

- (1) After processing (including heat treatment when required) all parts shall be temporarily protected against corrosion to the relevant specification. This operation may be deferred until after inspection if the latter falls within 8 hours of the processing (including heat treatment where relevant).

OLYMPUS 593

MK.610-14-28
OVERHAUL

L. Processes.

(1) Process A - Nitric Acid.

(a) Composition of solution.

- (i) The stripping solution is of the following composition:

Nitric Acid 400-450 g/l and is made up of:

Nitric Acid (SG 1.42)	43 vols
Water	57 vols

- (ii) The solution shall be contained in a stainless steel or P.V.C. tank fitted with extraction, and heating coil if required.
- (iii) The tank shall normally be operated at room temperature. Heated solutions may be used at the discretion of the local controlling laboratory.

(b) Stripping.

- (i) The coated area of the component shall be immersed in the solution, and stripping is complete when gassing ceases.

(c) Control.

- (i) The solution shall be analysed and maintained by suitable additions of nitric acid.
- (ii) Alternatively the solution may be discarded when it is no longer effective.
- (iii) Alternative strengths of acid may be used with the authority of the controlling laboratory.

(2) Process B - Sodium Hydroxide/Gluconate.

(a) Composition of solution.

(i) Ardrox 185

200-300 g/l (aqueous solution). This is made by one thorough mixing of 300 grammes of Ardrox 185 in one litre of water.

(b) Stripping.

(i) The coated area of the component shall be immersed in solution and stripping is complete when gassing ceases.

(c) Neutralise.

(i) Neutralising shall be carried out only when specified by the controlling laboratory.

(ii) The process of neutralising the components consists of immersing them for a minimum time of one minute in the solution prepared and operated in accordance with process C.

(iii) On removal from the neutralising solution the components shall be water washed to remove all traces of treatment solution.

(d) Control.

(i) The solution shall be analysed and controlled by suitable additions of sodium hydroxide/sodium gluconate.

(ii) Alternative proprietary approved solutions or "in house" solutions containing the specified ratios of sodium hydroxide/sodium gluconate may be used with the permission of the controlling laboratory.

(e) Limitations.

(i) Removal of metal/plasma/detonation sprayed deposits.

REPAIR

72-09-25

Page 405

Sep 1/80

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (f) Proprietary solutions.
- (i) Ardrox 185 Alkaline Deruster Salts from Ardrox Ltd., Bourne End, Bucks.
- (3) Process C - Neutralising Solution.
- (a) Composition of solution.
- (i) Chromic Acid (CrO_3)
- 80-100 g/l (aqueous solution). The solution is made up by thoroughly mixing 100 grammes of chromic acid in one litre of water.
- (b) Operation.
- (i) The solution is operated at 60°C - 65°C and may be contained in a P.V.C. tank.
- (c) Control.
- (i) The concentration of chromic acid, expressed as CrO_3 , shall be maintained at 80-100 g/l.
- (4) Process D - Meta Nitro Benzene Sulphonic Acid Sodium Salt.
- (a) Composition of solution.
- (i) The stripping solution is of the following composition:
- Nitro benzene sulphonic acid:
- | | |
|----------------|------------|
| Sodium salt | 55-65 g/l |
| Sodium cyanide | 90-180 g/l |
- (ii) The solution shall be contained in a mild steel tank. Other materials may be used with the authority of the controlling laboratory.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (iii) The solution shall normally be operated cold but may be heated up to 70°C for more rapid stripping. Consult local controlling laboratory for advice.

NOTE: Heating shortens bath life and increases the probability of base material attack.

(b) Stripping.

- (i) The coated area of the component shall be immersed in the solution.
- (ii) Stripping is not accompanied by any vigorous action, so components being stripped must be examined periodically for progress of stripping.
- (iii) Some metal/plasma/detonation coatings may take up to 24 hours to strip and this may be related to coating thickness.

(c) Control.

- (i) The solution shall be analysed and maintained by regular additions until the stripping rate becomes excessively slow (i.e. below 0.7 microns/hr of nickel from test plate plated to the relevant specification). On no account must the sodium cyanide level fall below 40 g/l or base material attack may occur.

(d) Proprietary solutions.

- (i) The basic constituent in powder form is available as Metex Strip Aid from Macdermid (U.K.) Ltd. or Enstrip S from Silvercrown P.E. Ltd.

MK.610-14-28

OVERHAUL

(5) Process E - Electrolytic Sulphuric Acid.

(a) Composition of solution.

- (i) The stripping solution is of the following composition:

Sulphuric acid 168-188 g/l
and is made up of:

Sulphuric acid (SG 1.84) 10 vols
Water 90 vols

- (ii) The acid must be added to the water very slowly and cautiously with stirring to disperse the heat evolved during mixing.
- (iii) The solution may be contained in a lead lined or plastic tank using lead plate cathodes.
- (iv) The tank should be operated at room temperature and be fitted with extraction.
- (v) If the solution is likely to exceed 40°C in use then lead cooling coils should be fitted to the tank.

(b) Stripping.

- (i) The component whose coating is to be stripped shall be made the anode.
- (ii) The stripping current (D.C.) shall be up to 0.6 A/sq. inch (1000 A/sq. metre) at between 6 to 8 volts.

(c) Control.

- (i) The solution shall be analysed and maintained by additions.

OLYMPUS 593
MK.610-14-28
OVERHAUL

(6) Process F - Electrolytic Rochelle/Carbonate.

(a) Composition of solution.

- (i) The stripping solution is aqueous and contains:

Sodium Carbonate	200 g/l
Rochelle Salt (Sodium Potassium Tartrate)	50 g/l

If Rochelle salt is not available, the solution may be made up as follows:

Sodium Carbonate	230 g/l
Tartaric Acid	30 g/l

- (ii) The solution may be contained in a lead lined mild steel tank, or in a plastic lined mild steel tank provided with lead cathodes.
- (iii) The tank shall be provided with heating and cooling coils to maintain an operating temperature of 40° - 60°C.
- (iv) The solution shall be mechanically agitated. Air agitation shall not be employed.

(b) Masking of components.

- (i) Certain Nickel or Cobalt based alloys are susceptible to attack in this solution. Advice on the desirability of masking uncoated areas of particular components, and on the choice of masking agent, should be obtained from the local controlling laboratory.

(c) Operative procedure.

- (i) Components shall be processed anodically at a maximum current density of 0.6 A/in² (1000 A/m²) based on the area of coating to be removed.

REPAIR

72-09-25

Page 409
Sep 1/80

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (ii) The voltage applied in the process shall not exceed 6.5 volts.
- (iii) Process time will depend upon the type, thickness and condition of the coating being stripped. Approximate stripping times should be determined practically for individual components or coatings, as a guide to operators.
- (d) Control.
 - (i) The solution is operated without analytical control and shall be discarded when no longer effective. The definition of "no longer effective" shall be agreed between shop supervision and the local controlling laboratory.
- (7) Process G - Kolene.
 - (a) Solution.
 - (i) Kolene K1/M3 is a proprietary material marketed by Cassel Heat Treatment Services of the Mond Division of Imperial Chemical Industries and is operated as a molten caustic bath containing a minimum of 8% sodium nitrate (NaNO_3).
 - (b) Operation.
 - (i) Details of the necessary equipment and operating instructions are obtainable from Imperial Chemical Industries Ltd. In all respects the manufacturers instructions regarding installation, operation and safety precautions shall be observed.
 - (ii) The bath shall be operated at a temperature of 450°C - 470°C .

TN3682

REPAIR

72-09-25

Page 410

Sep 1/80

OLYMPUS 593

MK.610-14-28

OVERHAUL

(c) Control.

- (i) During use the sodium nitrate content will tend to fall but additions of Kolene salts made to replace losses by drag out should normally replace this. The bath should be analysed for sodium nitrate and maintained by suitable additions.

(d) Neutralise.

- (i) Neutralise using process H, plus water wash (Ref.para.1.G.(1)).

(e) Limitations.

- (i) Not satisfactory for cooling passages less than 1,25 mm diameter or other inaccessible locations where salt entrapment may occur.

(f) Degraded coatings.

- (i) If coatings have only been degraded by the above sequence, the operation shall be completed by grit blasting in accordance with process K.

(g) Kolene supply.

- (i) The Kolene 1 salt bath material is available from; Kolene Corporation, Detroit, Michigan, and its approved subsidiaries.

(8) Process H - Neutralising Solution.

(a) Solution.

- (i) Typically this is an aqueous solution containing:

Sulphuric Acid (H_2SO_4) 184 g/l

1 litre of the solution may be made up as follows:

Add 100 ml Sulphuric Acid (SG 1.84) to 500 ml water, slowly stirring, cool to room temperature and make up to 1 litre with water.

REPAIR

72-09-25

Page 411

Sep 1/80

OLYMPUS 593

MK.610-14-28
OVERHAUL

(b) Operation.

- (i) The solution shall be contained in a rubber lined steel or polythene tank and used cold.
- (ii) The components shall be immersed in the solution for a minimum period of two minutes or until effervescence ceases, whichever is the longer period. The components shall then be allowed to drain over the tank.
- (iii) The solution shall be used until neutralised, as indicated by a blue litmus test. It shall then be discarded and replaced by a fresh solution.

(9) Process J - Alkaline Permanganate.

(a) Composition of solution.

- (i) This is an aqueous solution containing:

Sodium Hydroxide (NaOH)	80-120 g/l
Potassium Permanganate (KMnO ₄)	30-60 g/l

One litre of solution may be made up as follows: to 750 mls of water add 100 grammes of Sodium Hydroxide with caution, stir to dissolve and allow to cool to room temperature. Add 60 grammes of Potassium Permanganate, stir to dissolve and make up to one litre with water.

(b) Operation.

- (i) It is recommended that the solution is contained in a suitable austenitic stainless steel tank fitted with extraction unit and air agitation facility. The operating temperature is 95 deg C plus/minus 5 deg C.

TN2663

REPAIR

72-09-25

Page 412

Sep 1/80

OLYMPUS 593

MK.610-14-28
OVERHAUL

(c) Control.

- (i) The solution may be controlled by analysis and additions, or discarded when no longer effective.

(d) Neutralise.

- (i) 10% chromic acid or 30% nitric acid plus water wash (Ref.para.1.G.(1)).

(e) Limitations.

- (i) The above method only degrades the coating. Immersion times vary between 12 and 60 hours depending on activity of solution and coating density. The operation shall be completed by grit blasting in accordance with process K.

(f) Heat treated coatings.

- (i) Where coating has been succeeded by heat treatment in an oxidising atmosphere the above stripping method should be preceded either by sodium hydroxide/gluconate immersion to the appropriate specification or grit blasting as in process K.

(10) Process K - Dry Non-Metallic Abrasive Blasting.

(a) Control.

- (i) General requirements as 72-09-24, Repair.

(b) Parameters.

- (i) Use a 16/24 (700/1000 microns) aluminium grit where feasible (see limitations) at 30 p.s.i. with a pressure type machine or 75 p.s.i. with vacuum type equipment. Optimum nozzle work piece distance of 3 inches. Other sizes of grit may be used with permission of the controlling laboratory.

REPAIR

72-09-25

Page 413

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (ii) Where grit contamination of surfaces is a problem components may be water washed as required (Ref.para.1.G.(1)).
- (c) Limitations.
 - (i) Excessive distortion may occur on thin walled components. In such cases, bracing jigs shall be used, or smaller size alumina grit and/or corresponding lower working pressures.
 - (ii) The equipment used should be specifically retained for stripping since rapid grit contamination will occur. Alternatively the grit supply in the cabinet shall be discarded on completion of a stripping programme.

DETONATION FLAME DEPOSITION

1. Applying Coating

A. General.

- (1) Detonation flame deposition is a proprietary process of Union Carbide Ltd., to whom components should be despatched. This standard practice describes the preparation of the component prior to despatch and inspection on return.

B. Safety Precautions.

- (1) Under certain circumstances some of the chemicals and processes referred to in this standard practice may be hazardous to health and/or safety. Before putting this process into operation for the first time, those responsible shall consult their supervision and local controlling laboratory in regard to the safe working practices to be adopted. Nothing in this standard practice shall relieve an operator of his responsibility in respect of the provision of safe working methods and the safety of his operators.

C. Corrosion Protection.

- (1) It should be noted that most metallic surfaces are susceptible to corrosion, particularly after operations which leave the metal dry and exposed to atmospheric conditions. It is therefore, of the utmost importance that suitable protection requirements be considered in relation to the planning and/or manufacture of metallic parts at all stages. The foregoing instruction is not necessarily satisfied by the provisions of any specific clause which may appear elsewhere in this standard practice.

72-09-26

Page 401

Sep 1/80

OLYMPUS 593

MK. 610-14-28
OVERHAUL

D. Condition of Components.

- (1) Whenever possible the application of detonation coatings shall be after the application of all other processing. Components for spraying shall be in a scale and rust free condition.
- (2) It is essential that parts despatched for processing, particularly close tolerance parts, shall be dimensionally accurate in accordance with drawing requirements. The coatings are not intended to compensate for dimensional inaccuracies and failure to observe this precaution may result in finished parts which are either oversize or on which the coating could be completely removed by finishing.
- (3) Parts shall be temporarily protected against corrosion, in accordance with the relevant specification, prior to despatch to Union Carbide Ltd. There must be no evidence of any previously applied coatings on the area to be processed by Union Carbide Ltd. unless prior agreement between the operator and Union Carbide Ltd. has been established with regard to the stripping of such surfaces.

E. Inspection on Receipt.

- (1) The deposit shall be inspected to ensure conformity to drawing, uniformity of deposit and that there is no evidence of blistering, lifting, cracking or chipping.
- (2) Any faulty deposit is to be completely removed prior to re-processing.

F. Finishing.

- (1) Finish the component as specified in the repair.
- (2) Brushing is used to smooth or bed-down the coating and the surface should be brushed until it appears or feels smooth. Brushing is not to be used on parts with close tolerance dimensions.

IN1680

REPAIR

OLYMPUS 593

MK.610-14-28

OVERHAUL

(3) Ground coating, when finished, must not appear polished or glazed. Such an appearance will be accompanied by heat chequering or grinding cracks.

(4) Finishing methods.

NOTE: The following information is given as a guide to grinding, lapping and brush finishing techniques, but further details may be obtained from Rolls-Royce controlling laboratory or from Union Carbide Ltd.

(a) Grinding.

- (i) Diamond wheel grinding is the principal method used to produce dimensionally precise coatings. The use of improper grinding techniques can cause heat chequering, particle pull-out, chipping and consequent failure of otherwise flawless coatings.
- (ii) The diamond wheel must comply with the following specification:

100 concentration.
Resinoid bond.
- (iii) The grinding machine spindle must run true, the back-up plate must be square to the spindle and all jibs and ways must be tight and true.
- (iv) The diamond wheel shall be balanced on its own mount and must be allowed no more than 0.0002 in. (0,005 mm) run-out.
- (v) The peripheral wheel speed shall be from 5000 to 6500 surface feet per minute (25 to 32 metres per second).
- (vi) Flood coolant shall be used, consisting of water plus 1% to 2% water-soluble oil of neutral pH. The coolant shall be directed at the point of contact of the wheel and the work piece, and shall be filtered during use.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (vii) Before grinding each part, the wheel shall be cleaned with a silicon carbide stick.
 - (viii) Correct feeds must be maintained. Minimum in-feed per pass 0.0005 in. (0,013 mm) and maximum cross-feed per pass or revolution 0.080 in. (2,0 mm).
 - (ix) The wheel shall always be maintained in a free-cutting condition.
 - (x) Aluminium oxide wheels must not be used on coatings. Silicon carbide wheels may be used when recommended by Union Carbide Ltd.
- (b) Lapping.
- (i) A hard serrated lap shall be used made from GM Mechanite or similar material.
 - (ii) Approved diamond abrasive must be used, and this shall be firmly embedded in the lap.
 - (iii) A thin lubricant shall be used, such as mineral spirit.
 - (iv) The lapping pressure shall be 20-25 lbs/sq.inch (1.4 to 1.75 kgf/cm²) wherever possible.
 - (v) Lapping speeds shall be 100-300 surface feet per minute (50-150 cm per second).
 - (vi) The lap shall be recharged when the lapping time increases by 50% or more.
- (c) Non-precision wet brush finishing.
- (i) Brush finish techniques may be used to produce a smooth modular surface on a component.
 - (ii) Parts shall first be sanded with 220 grit silicon carbide paper.

TN24806

REPAIR

72-09-26

Page 404

Sep 1/80

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (iii) The brush finishing operation is then carried out by means of a soft cotton string rotary brush running at 4000 to 6000 surface feet per minute (20 to 30 metres per sec) and a medium of silicon carbide slurry. The slurry is composed of 20% by weight of 240 grit silicon carbide in water, with the addition of a small amount of rust inhibitor.
 - (iv) The finished surface should have a modular "orange peel" texture, free from any sharp protrusion.
- (d) Non-precision sanding/diamond finishing.
- (i) Non-precision techniques may be used to remove the sharp particle peaks from the as coated surface.
 - (ii) The precise technique is dependant upon part geometry, coating type and thickness.
 - (iii) The technique can be accomplished either manually or by machine. Hand finishing requires the use of silicon carbide paper of 180, 220, 320 and 400 mesh grit or 408M Cratex stick. Machine finishing employs the use of 15 micron, 220 or 100 mesh diamond impregnated cloth mounted on a flexible rotary pad, lubricated with water. A 408M Cratex wheel can also be used in conjunction with 6 or 14 micron diamond paste.
 - (iv) The finished surface of the coating should exhibit a truncated appearance, whilst still retaining evidence of the as coated surface.

G. Inspection After Finishing.

- (1) After finishing, a visual inspection shall be carried out using magnification up to X7 where necessary. There must be no evidence of discolouration, cracking, plucking or polishing.

REPAIR

72-09-26

Page 405

Sep 1/80

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (2) Penetrant inspection to the relevant specification may be required on certain critical parts and shall be carried out as instructed by the local controlling laboratory or quality control.
- (3) The inspection of ground carbide deposits is very important in order that the grinding operation may be monitored. This is necessary due to the possible rapid deterioration of the grinding wheels.
- (4) Any faulty deposits shall be completely removed prior to re-preparation and re-application of the deposit (Ref.para.1.D.3.).

REMOVAL OF METAL SPATTER FROM HP
TURBINE ROTOR BLADES

1. Removing Spatter

A. General.

- (1) This standard practice details the method for removing metal spatter from HP turbine rotor blades.

B. Safety Precautions.

- (1) Under certain circumstances some of the processes referred to in this standard practice may be hazardous to health and/or safety. Before carrying out any of the detailed processes initially, those responsible shall consult their supervision in regard to the safe working practices to be adopted. Nothing in this standard practice shall relieve an operator of his responsibility in respect of the provisions of safe working methods and the safety of his operators.

C. Removal Procedure.

- (1) Mask the blade fir tree roots and dry abrasive blast the aerofoil to remove spatter. Refer to Chapter 72-09-24, Repair, for blasting procedure.
- (2) Inspect to ensure satisfactory blasting has been carried out, and spatter removal has been achieved.
- (3) Heat treat the blades to 580°C plus/minus 10°C for 1 hour. Cool in air.
- (4) Inspect aerofoils for loss of pack aluminising. Blue-purple colour indicates loss of coating. Straw-gold colour indicates presence of aluminising.

WELD REPAIR OF PD21 MATERIAL

1. Welding

A. General.

- (1) This standard practice details the method for weld repairing components manufactured from PD21 material.
- (2) PD21 is a complex high temperature nickel base super alloy used in the "as-cast" condition. The micro-structure in this condition makes the alloy essentially unweldable due to heat affected zone cracking which extends into the parent and weld metal. These cracks are initiated at, and propagated along coarse complex carbide microstructural features. The method detailed in this standard practice aims to improve weldability by refining these microstructural features by heat treatment, thereby reducing the susceptibility to cracking and reducing the potential crack propagation path when cracking does occur.

B. Safety Precautions.

- (1) Under certain circumstances, some of the processes referred to in this standard practice may be hazardous to health and/or safety. Before carrying out any of the detailed processes initially, those responsible shall consult their supervision in regard to the safe working practices to be adopted. Nothing in this standard practice shall relieve an operator of his responsibility in respect of the provisions of safe working methods and the safety of his operators.

C. Repair Welding.

- (1) It has been found necessary to carry out extensive welder training to develop the technique necessary for PD21. This consists of minimising the heat input and thereby the heat affected zone. This can lead to "lack-of-fusion" type defects so that a delicate balance has to be achieved. This training phase is supported by full non-destructive examination of test welds and finally by sectioning and metallurgical assessment.

REPAIR

72-09-28

Page 401

Jun 1/92

OLYMPUS 593

MK.610-14-28
OVERHAUL

(2) Due to the difficulty in welding, it is necessary, to scrupulously follow the following standardised welding procedure:

- (a) Inspect to establish crack lengths.
- (b) Notch to remove cracks using simple carbide burr.
- (c) Condition heat treat 1120°C for 18 hours in a vacuum, followed by inert gas quench.
- (d) Critical penetrant examination to ensure complete removal of crack.
- (e) Re-notch if necessary.
- (f) T.I.G. weld repair by trained welder using INCO 625 filler and the following parameters.
 - (i) D.C. welding equipment.
 - (ii) 0.433 in (11.00 mm) torch size (water cooled).
 - (iii) 0.630 in (16.0 mm) tungsten electrode (thoriated).
 - (iv) 45-65 amp current range.
 - (v) Argon purging gas.
 - (vi) Gas flow:
torch 12-15 cu ft/hr (6-8 litres/min).
backing 3 cu ft/hr (1.5 litres/min),
(100% of backing gas to pass through chills).
 - (vii) Use gas lens.
 - (viii) Welding carried out at room temperature.
- (g) NDT - penetrant and X-Ray.
- (h) Re-notch any welding cracks. If these extend into the parent material, repeat the conditioning heat treatment.
- (j) Repeat full NDT.

INERT GAS ARC WELDING OF FRETTED/DAMAGED TUBES - REPAIR

1. Weld Repair

A. Repair Limitations.

- (1) Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.
- (2) Direct welding of fretting/damage is limited to maximum depth of 50% of the gauge thickness of the individual tube (for minimum gauge thickness of tube, refer to para.6 of individual repair).
- (3) Maximum size of repairable fret/damage mark to be contained within an envelope 0.350 x 0.350 (8,90 x 8,90) (Refer to Fig.401).
- (4) This repair does not cover welding of fittings, which must be replaced to the appropriate repair instructions.

B. General (Unless Otherwise Specified).

- (1) Drawing practice and tolerance interpretation to ISO1101 (JES160).
- (2) Dimensions in Inches (Millimeters).
- (3) Tolerances on machined dimensions plus/minus 0.010 (0,25).
- (4) Tolerances on angles plus/minus 2 degrees.
- (5) Break sharp edges 0.004 to 0.020 (0,1 to 0,5).
- (6) Surface texture interpretation to ISO1302 (JES137).
- (7) Surface texture to be 125 (3,2) Microinches (Micrometers).
- (8) Welding symbols to ISO2553 (JES139).
- (9) 3rd Angle Projection.

C. Repair Procedure.

Repair Procedure

Supplementary Information

- | | |
|---|---|
| (1) Clean fretted/damaged areas and prepare for welding. | Refer TSD 594 OP.409. |
| (2) Degrease areas to be welded immediately prior to welding. | Refer TSD 594 OP.101. |
| (3) Build up fretted/damaged area by inert gas arc welding. Apply sufficient weld metal to restore outer diameter of tube. Group 1 weld classification. | Refer TSD 594 OP.409.
Use filler rods to OMat 306. |
| (4) Radiographically inspect weld for defects. | Refer TSD 594 OP.409
Appendix 2. |
| (5) Dress weld to restore diameter, adjacent parent material is not to be impaired. Maintain surface finish. | Note: Use adjacent undressed areas as a guide for surface finish. |
| (6) Polish tube diameter to remove discolouration. | |
| (7) Locally inspect repair area for cracks. | Refer TSD 594 OP.210. |
| (8) Visually inspect on completion of repair. | Refer TSD 594 OP.409
Appendix 2. |
| (9) Pressure test tube if required. | Refer to Para.6 of individual repair. |
| (10) Vapour degrease tube. | Refer TSD 594 OP.101. |

DAMAGED AND/OR FRETTED TUBES - REPAIR

1. Repair

A. Repair Limitations.

(1) The repair of damage to tubes by fretting of clips or other forms of damage is covered by this repair. The tubes may be repaired according to the following basic requirements.

- (a) Where edge of fretted area is not less than 1.650 in. (41,90 mm) from commencement of a bend or curve, use of a "tube joint" will normally be sufficient. The standard length to be used is L20 i.e. 2.000 in. (50,80 mm) at clip positions (Ref. Details C, D, E, F, G and H, Figs.402 and 403).
- (b) Where edge of fretted area is less than 1.650 in. (41,90 mm) from commencement of a bend or curve, this will require a new section of tube with bend (or bends) produced from tube as specified on relevant standard tube assy. drawing and formed in accordance with master tube gauge and may also require new end/intermediate fitting(s) due to loss of autogenous lip (Ref. Details B, J, K and L, Figs.401, 403 and 404).
- (c) A repair weld line must not occur in area which will be covered by a clip (Ref. Details E and F, Fig.402).
- (d) An L5 tube joint may be used for other types of damage or joint where practicable (Ref. Details J and K, Figs.403 and 404).
- (e) This repair covers range of tubes 0.025/0.031 in. (0,67/0,79 mm), 0.032/0.044 in. (0,81/1,12 mm) and 0.064/0.068 in. (1,63/1,73 mm) gauge.

B. General (Unless Otherwise Stated).

- (1) Drawing practice and tolerance interpretation to ISO 1101 (JES 160).
- (2) Dimensions in Inches (Millimeters).
- (3) Tolerances on machined dimensions plus/minus 0.010 (0,25).

REPAIR

72-09-30

Page 401
Jul 31/93

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (4) Tolerances on angles plus/minus 2 degrees.
- (5) Break sharp edges 0.004 to 0.020 (0,1 to 0,5).
- (6) Welding symbols to ISO 2553 (JES 139).
- (7) Surface texture interpretation to ISO 1302 (JES 137).
- (8) Surface texture to be 63 (1,6) Microinches (Micrometers).

C. Re-Use of Fittings.

- (1) To reduce cost, serviceable fittings removed during repair should be re-used wherever possible (e.g. nuts, ferrules, end fittings, junctions, tee-pieces, seal carriers etc.).
- (2) When re-using fittings the original autogenous lips provided for new manufacture (Ref. Detail A, Fig.401) are replaced by suitable tube joints (Ref. Detail B, Fig.401).
- (3) Diameter 'D' and tube ends to be dressed to provide a fit of 0.000 to 0.004 in. (0,00 to 0,10 mm) clearance in the lip of the selected tube joint. End faces of fittings to be trimmed square within 0.0015 in. (0,038 mm) of axis (applicable to all re-used welded fittings (Ref. Detail B, Fig.401)).
- (4) For 0.312 to 1.250 in. (7,94 to 31,75 mm) diameter tube select from range B445301-10. For 1.500 and 1.750 in. (38,1 and 44,45 mm) diameter tube select from B497486 or B497487. For 2.250 and 3.096 in. (57,15 and 78,64 mm) diameter tube select from B514649 or B514650.
- (5) When re-use is not possible a new fitting of the same part number is required.
- (6) In all cases the assembly must conform to the master tube gauge form.

D. Repair Procedure.

(1) Preparation.

NOTE: Refer to relevant cleaning section of Overhaul Manual for tube, prior to repair, for general condition of tube.

- (a) Cut out defective section(s) as shown (Ref. Details C, J, K and L, Figs.402, 403 and 404). Cut-out to be so sized as to conform with intended tube joint length to be used, plus bend(s) when required. Trim ends of tube square to within 0.0015 in. (0,038 mm) of axis.

(2) Inspect.

- (a) Test for cracks (Refer to TSD 594 Op.210).

(3) Weld.

NOTE: Use relevant tube joints (Refer to Fig.402) and any tube bend sections required.

- (a) Mechanised Argon Arc Weld to complete the assembly to master tube gauge form (Refer to Figs.402, 403 and 405, Details D, H, M, N, P and R and TSD 594 Op.409).

- (b) Polish repaired area.

(4) Inspect.

- (a) Test for cracks (Refer to TSD 594 Op.210).
- (b) X-Ray (Refer to TSD 594 Op.221 and 409, Appendix 2).

(5) Final Inspection.

NOTE: Refer to relevant cleaning section of Overhaul Manual for tube, after repair, for general condition of pipe.

- (a) Pressure test to the requirements detailed in relevant repair section.

(6) Identification.

- (a) Mark repair identity as detailed in relevant repair section.

LP AND HP COMPRESSOR ROTOR BLADES - REPAIR BY IN-SITU BLENDING

1. General

The instructions given in this chapter deal with the in-situ blending and polishing of damaged Stage 1-7 LP and HP Compressor Rotor Blades.

In-situ blending and polishing of the Stage 1 LP compressor rotor blades can be carried out using standard hand tools.

In-situ blending and polishing of Stage 2 to 7 LP compressor rotor blades and Stage 1 to 7 HP compressor rotor blades is achieved through the inspection ports on the LP and HP Compressor Casings using the blade blending kit (Tool Item No.3146).

It is recommended that two skilled operatives be used to assess the extent of blending required before using the procedures contained in this chapter. It is recommended that the Blade Training Aid (Tool Item No.3169) is used to maintain operatives blending proficiency, using scrapped blades.

The debris produced by this process will not normally be harmful to the engine. However, if large pieces of blade become detached during the procedure, contact the Olympus 593 Project Office, Rolls-Royce plc, Filton, Bristol.

2. Tools and Equipment

3. Blade Blending Training Aid

A. General

- (1) This equipment provides a means of maintaining proficiency in the techniques necessary to perform in-situ blade blending.
- (2) The equipment comprises a box housing a simulation of a 3 blade section (stages 2, 3 and 4) of the HP compressor rotor. These stages provide blade samples of varying section and both materials used in the compressor (titanium and nimonic 90).
- (3) The rotor block is fitted with a tilt mechanism enabling the rotor blades to be moved relative to the stator vanes. This enables the user to achieve the optimum position for the selected blend.
- (4) Calibration blades are included in a separate compartment, and provide engraved damage marks equivalent to the maximum allowable per zone, per stage.

B. Equipment Operation

- (1) Load calibration blade(s) into position and tighten clamp block to secure.
- (2) Close box and place in a position to best suit the operator.
- (3) Assess damage using blending tool fitted with comparator head.
- (4) Remove calibration blade(s).

OLYMPUS 593

MK.610-14-28
OVERHAUL

sneema

- (5) Load 'scrap' blade(s) into position, and tighten clamp block to secure.
- (6) Assess damage using blending tool fitted with comparator head.
- (7) Record details of damage.
- (8) Replace with cutting tools and blend defect until removed.
- (9) Replace cutting tool with comparator head and reassess size of blended defect.
- (10) Open box, remove blade and review acceptability of blend against criteria as detailed in repair procedure.

4. Terminology for Damage

A. Apply the following definitions to the terms used to describe damage to the LP and HP compressor rotor blades:

- (1) Bend. A sharp deviation from original line or plane (associated terms, crease, fold, kink, lean).
- (2) Crack. Visible partial separation of material which may progress to a complete break (a break is defined as a separation by force into two or more pieces).
- (3) Curl. Tips of blades or vanes curled over due to rubbing.
- (4) Dent. An indentation usually caused by impact of an object; parent metal is displaced, seldom separated.
- (5) Nick. A sharp surface indentation.
- (6) Score. Deep scratch.
- (7) Scratch. Light, narrow, shallow mark; material is not removed.
- (8) Tear. Separation by pulling apart.

Blade	Area	Repair Possible
HP Stage 6	Leading Edge	YES
	Trailing Edge	NO
HP Stage 7	Leading Edge	NO
	Trailing Edge	YES

Table 401 - LP and HP Compressor Rotor Blade Repair Areas
Concluded

- B. Blades with dents, which deform the opposite surface of the blade, are not acceptable for blending; reject blades with this form of damage.
- C. Blends must exceed the depth of damage by 20 per cent.
- D. Blends must not run out into Zone X.
- E. Only blends to rectify minor damage to a maximum depth of 0.010 in. (0,25 mm) are allowed in Zone X.
- F. Due to limited access through the inspection ports on LP compressor Stages 2-7 and HP compressor Stages 1 to 7, it is not possible to carry out blending to the tip of the blades. Damage should therefore be assessed prior to commencing any repair, to ensure that tool access is sufficient to allow full blend radii to be achieved without creating a 'hooked' aerofoil (Ref. Fig.419).

6. Prepare Engine for Repair

- A. Install LP/HP compressor turning Equipment (Ref. 72-09-01 Engine Turning).
- B. Remove or loosen engine-dressing items as necessary to gain access to the blanking plugs on the LP or HP compressor casing as required.
- C. Remove the appropriate blanking plug from the LP or HP compressor casing (Ref. Fig. 402, 403, 404 and 405).

7. In-Situ Blade Blending Procedures

- A. In-situ blending of Stage 1 LP Compressor Rotor Blades using standard hand-tools (Ref. Fig. 409).

CAUTION 1: DO NOT BLEND CRACKS.

CAUTION 2: IF MECHANICAL BLENDING METHODS ARE USED, ENSURE THAT BLADES ARE NOT OVERHEATED.

- (1) Assess the extent and depth of the damaged blade using the comparator (Ref. Fig.406).

NOTE: This procedure should be carried out by two separate skilled operatives to ensure an accurate assessment.

- (2) Carry out a dye penetrant inspection of all damaged areas before and after blending. (Ref. 72-09-00 Inspection/Check).
- (3) For blends carried out on edge only, the depths D and E must not exceed 0.600 in. (15,0 mm) and 0.250 in. (6,0 mm) respectively.
- (4) For blends carried out on both edges, the depths D and E must not exceed 0.300 in. (8,0 mm) and 0.120 in. (3,0 mm) respectively.
- (5) If blends interfere, metal must be removed to produce a coupled blend.
- (6) A maximum of two blends or one coupled blend per zone is permitted.
- (7) Torn, rough or scored edges must be blended to a depth 20 per cent greater than the damage depth.
- (8) Blends must be smoothly profiled into the aerofoil shape. Leading and trailing edges should be blended into a radius and should not leave a knife-edge.
- (9) Defective areas and blends to be polished to produce a good surface finish.

OVERHAUL

- B. In-situ blending of Stage 2-7 LP Rotor Blades and Stage 1-7 HP Rotor Blades using Blade Blending Kit (Tool Item No.3146) (Ref. Figs. 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418 and 419).

(1) General tool selection and operation

- (a) Select the appropriate cutter according to which stage and area of blade requires blending (Ref. Fig. 401)

NOTE: The tools are listed as a guide only, operators may choose to use a different length cutter or polisher to that specified for a certain stage.

- (b) Information regarding the sizes and type of blade material are given in Table 402 - LP and HP Compressor Rotor Blade Information, to further assist in the cutter selection.

- (c) The blade blending kit may be used on its own or in conjunction with a CCD camera attachment and TV monitor.

DESCRIPTION	MATERIAL	QTY	MAX WIDTH		AEROFOIL LENGTH

*ROUNDED FIGURES

Table 402 - LP and HP Compressor Rotor
Blade Information (Concluded)

- (d) The comparator is installed in the tool head and used in place of a cutter to inspect and assess the extent of the damaged blades (Ref. Fig.406).
- (e) It is recommended that a large diameter boroscope is used periodically instead of the blending kit boroscope for inspection of the blend, this will enable a clearer view of the blend.
- (2) Procedure (Ref. Figs. 406, 407 and 408)

CAUTION: THE LP/HP COMPRESSOR ROTOR MUST BE LOCKED BEFORE ATTEMPTING ANY MEASUREMENT OR REPAIRS.

- (a) Lock the LP/HP compressor rotor in the required position using the adaptor and immobiliser (Tool Item No.3147). Due to the geometry of the blades, it may be necessary to unlock, rotate and re-lock the rotor to obtain the optimum position for blending (Ref. Fig.407).

- (b) Assess the extent and depth of the damaged blade using the comparator (Ref. Fig.406).

NOTE: This procedure should be carried out by two separate skilled operatives to ensure an accurate assessment.

- (c) Assess the suitability for repair in accordance with paras. 7 and 8.

CAUTION: THE CUTTER IS LOCATED IN THE HEAD USING A TWIN SCREW THREAD. BEFORE USING THE BLADE BLENDING TOOL, ENSURE THAT THE CUTTER IS LOCATED CORRECTLY IN THE HEAD. THERE SHOULD BE NO GAP BETWEEN THE CUTTER SHANK AND THE TOOL HEAD.

CAUTION: BEFORE USE, ENSURE THAT THE DIRECTION OF CUTTER ROTATION IS CORRECT. WHEN VIEWED FROM ABOVE, THE TOOL MUST ROTATE ANTI-CLOCKWISE.

CAUTION: BEFORE USE, ENSURE THAT THE BOROSCOPE, IS CORRECTLY LOCKED IN THE TOOL.

- (d) Select and install the appropriate cutter in the tool head (Ref. Para. 6.B.(1)).

- (e) Straighten the tool head and insert the blending scope through the inspection port.

CAUTION: DO NOT SWITCH THE CUTTER ON BEFORE ARTICULATING THE TOOL HEAD. THIS WILL RESULT IN THE DISENGAGEMENT OF THE CUTTER DRIVE BELT.

- (f) Articulate the tool head through approximately 90 degrees, visually check the cutter position in relation to the blade, then switch on and select a high-speed setting.

NOTE: The operating range of the tool is between 80 - 100 degrees. The tool will not operate when the tool head is articulated outside of this range.

CAUTION: DURING BLENDING OPERATIONS, CARE MUST BE TAKEN TO AVOID TOOL HEAD AND SHANK CONTACT WITH ADJACENT BLADES.

(g) Carry out roughing cuts to remove damage.

NOTE: If too much pressure is applied to the tool, the cutter may stop due to belt slippage. If this happens carefully release the pressure and resume cutting.

(h) Switch off the cutter, articulate the tool head straight and withdraw the blending scope from the engine.

(i) Remove the cutter from the tool head. Select and install a radius cutter (Ref. Para. 6.B.(1)).

(j) Straighten the tool head and insert the blending scope through the inspection port.

CAUTION: DO NOT SWITCH THE CUTTER ON BEFORE ARTICULATING THE TOOL HEAD. THIS WILL RESULT IN THE LOSS OF THE CUTTER DRIVE BELT.

(k) Articulate the tool head through approximately 90 degrees, visually check the cutter position in relation to the blade, then switch on and select a high-speed setting.

NOTE: The operating range of the tool is between 80 - 100 degrees. The tool will not operate when the tool head is articulated outside of this range.

CAUTION: DURING BLENDING OPERATIONS, CARE MUST BE TAKEN TO AVOID TOOL HEAD AND SHANK CONTACT WITH ADJACENT BLADES.

(l) Carry out radius cutting.

NOTE: If too much pressure is applied to the tool, the cutter may stop due to belt slippage. If this happens carefully release the pressure and resume cutting.

- (m) Switch off the cutter, articulate the tool head straight and withdraw the blending scope from the engine.
- (n) Remove the cutter from the tool head. Select and install a polisher (Ref. Para. 6.B.(1)).
- (o) Straighten the tool head and insert the blending scope through the inspection port.

CAUTION: DO NOT SWITCH THE CUTTER ON BEFORE ARTICULATING THE TOOL HEAD. THIS WILL RESULT IN THE LOSS OF THE CUTTER DRIVE BELT.

- (p) Articulate the tool head through approximately 90 degrees, visually check the cutter position in relation to the blade, then switch on and select a high-speed setting.

NOTE: The operating range of the tool is between 80 - 100 degrees. The tool will not operate when the tool head is articulated outside of this range.

CAUTION: DURING BLENDING OPERATIONS, CARE MUST BE TAKEN TO AVOID TOOL HEAD AND SHANK CONTACT WITH ADJACENT BLADES.

- (q) Carry out finish polishing.

NOTE: If too much pressure is applied to the tool, the cutter may stop due to belt slippage. If this happens carefully release the pressure and resume polishing.

- (r) Switch off the polisher, articulate the tool head straight and withdraw the blending scope from the engine.
- (s) Remove the polisher from the tool head; install comparator.
- (t) Inspect and measure the blend using the comparator (Ref. Fig. 406).
- (u) Record details of the repair.

- (3) Remove in-situ blade blending equipment.
 - (a) On completion of in-situ blade blending repair, remove blending tool from engine.
 - (b) Ensure that the power supply is switched off, then disconnect the power unit.
 - (c) Dismantle in-situ blade blending equipment and stow in appropriate storage containers.
 - (d) Remove the LP and/or HP compressor turning equipment (Ref. 72-09-01 Hand Turning).
- (4) Blending repair limits (Ref. Figs. 409, 410, 411, 412, 413, 414, 415, 416, 417, 418 and 419)
 - (a) Blend torn, rough or scored edges to depth 20 per cent greater than the depth of damage measured using the comparator (Ref. Fig.406) provided that specified limits are not exceeded.
 - (b) If blends interfere, metal must be removed to produce a coupled blend.

- (c) Blends must be smoothly profiled into the aerofoil shape. Leading and trailing edges should be blended into a radius and should not leave a knife-edge.
- (d) Polish all blends and defective areas to achieve a good surface finish with no machining marks.
- (e) Remove only the minimum amount of material consistent with specified requirements and dimensions.
- (f) In Zone X, the maximum blend depth is limited to 0.010 in. (0.25 mm) maximum.
- (g) For opposing blends the chordal width must not be reduced by more than A, B or C, as applicable.
- (h) The blending and polishing of marks is acceptable only in a radial direction, from root to tip. Some residual post blending MINOR marking around the blend is acceptable.

8. Assessment of Amount of Blending per Blade (All Stages)

A. General

- (1) Blades may be blended in several positions provided that the total extent of blending is not more than the equivalent of two blends in the maximum zone Z.
- (2) The depth of blending is controlled by the zonal location of the damage.
- (3) The maximum permissible number of blended blades per stage, when blended to maximum limits is identified as L on the illustrations.
- (4) Where blades are not blended to the permissible maximum, this number (Ref. Para C.) may be increased, provided that the aggregate of the blending does not exceed L.

B. Permissible blending is controlled by depths. Example for LP Compressor Stage 1 blade.

- (1) 0.600 in. (15,24 mm) depth x two blends = 1.200 in. (30,48 mm) total = maximum blended blade.

REPAIR

OVERHAUL

- (2) This maximum may be obtained as defined in (a), (b) or (c), or by any combination of depths the total of which does not exceed 1.200 in. (30,48 mm).
 - (a) 0.300 in. (7,62 mm) depth x four blends.
 - (b) 0.150 in. (3,81 mm) depth x eight blends.
 - (c) 0.100 in. (2,54 mm) depth x twelve blends.
- C. Permissible blending is controlled by depths. Example for HP Compressor Stage 1 blade.
 - (1) 0.150 in. (3,81 mm) depth x two blends = 0.300 in. (7,62 mm) total = maximum blended blade.
 - (2) This maximum may be obtained as defined in (a), (b) or (c), or by any combination of depths the total of which does not exceed 0.300 in. (7,62 mm).
 - (a) 0.100 in. (2,54 mm) depth x three blends.
 - (b) 0.075 in. (1,90 mm) depth x four blends.
- D. One coupled blend = two blends.
- E. Dimension D blend = one blend.
- F. Dimension E blend = half blend (depth assessed as RADIUS divided by 2).
- 9. Assessment of Blending Equivalent to L Number of Blended Blades Per Stage
 - A. Example for LP Compressor Stage 1 blade.
 - (1) L = three blades x 1.200 in. (30,48 mm) depth = 3.600 in. (91.44 mm) aggregate depth.
 - (2) This aggregate may be obtained as defined in (a), (b) or (c), or by any aggregate of blended blades which does not exceed 3.600 in. (91,44 mm).
 - (a) 0.900 in. (22,86 mm) depth x four blades.
 - (b) 0.600 in. (15,24 mm) depth x six blades.
 - (c) 0.300 in. (7,62 mm) depth x twelve blades.

sneema

B. Example for HP Compressor Stage 1 blade.

- (1) L = three blades x 0.300 in. (7,62 mm) depth = 0.900 in. (22,86 mm) aggregate depth.
- (2) This aggregate may be obtained as defined in (a) or (b), or by any aggregate of blended blades which does not exceed 0.900 in. (22,86 mm).
 - (a) 0.180 in. (4,57 mm) depth x five blades.
 - (b) 0.150 in. (3,81 mm) depth x six blades.

10. Install Blanking Plugs and Engine-Dressing Items.

- A. Assemble all blanking plugs removed to gain access to the LP and/or HP compressor rotor blades (Ref. 72-09-03 Inspection/Check).
- B. Assemble and secure all engine-dressing items removed or loosened to gain access to the LP and/or HP compressor case blanking plugs.

11. Conclusion

- A. Ensure repair details are recorded.
- B. A post repair inspection should be carried out after 10 flight hours and then again at the next S inspection at 230 hrs. (Ref. 72-09-03 - Inspection/Check).
- C. Rolls Royce Limited/SNECMA reserve the right to amend all or part of the acceptance standards stated in this repair procedure, as engine operational experience, with damaged blades, is gained.

AIR INTAKE FAIRING - REPAIR
REMOVING DENTS FROM OUTER SKIN

Applicable to:

Fairing B.458651

Authority:

Modification No. OL.8423C

1. Introduction

- A. This Repair describes the procedure for repairing air intake fairings on which the outer skin is dented in excess of the acceptance standards specified in 72-20-00 Inspection/Check.
- B. Dimensions are shown thus on the illustration:
INCHES (MILLIMETRES).

2. Summary of Operations

- A. Ensure that the radius of sharp dents is not less than that specified on the view SECTION AA. Fairings which do not conform with this requirement must not be repaired by this scheme.
- B. Restore soft dents in the specified central area (Ref.Fig.401) to the original profile. Do not locally reduce material thickness to less than 0.020 in. (0,5 mm).
- C. Test for cracks by the fluorescent penetrant process specified for this component in 72-20-00 Inspection/Check.
- D. Identify repair. Mark the repair scheme number SAL B.478064 close to the standard part number on the fairing.

AIR INTAKE FAIRING - REPAIR
PROVISION FOR REMOVAL AND REPLACEMENT
OF DAMAGED FAIRING INNER SKIN

MODIFICATION NO. OL.8699C AND OL.8760

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-21-01	1 10A	B.458651

2. Introduction

A. General.

- (1) This repair describes the procedure to remove a damaged inner skin on an air intake fairing and replace it.
- (2) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (3) Dimensions are shown thus, INCHES (MILLIMETERS) in tables and illustrations.
- (4) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (6) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (7) Surface texture to be 125 microinches (3,2 micro-meters) unless otherwise stated.
- (8) All tools referred to by item number in procedural steps are detailed in para.4.
- (9) Protect the component against corrosion after each operation and place in a container for protection against damage during transit between operations.

3. Instructions

A. Remove Inner and Outer Skins.

- (1) Fill air intake fairing with non-crystalline wax to the extent shown at Fig.401.
- (2) Locate air intake fairing to the base of holding fixture ref. tool item 1 (Ref.Fig.401) ensuring that when the adjustable support is supporting the inner skin, the fairing support ring is seated on the fixture baseplate completely.
- (3) Measure dimension X (Ref.Fig.402) and record, noting this dimension is original.
- (4) Locate air intake fairing/fixture base assy. to a center lathe and clock true. Locate fixture support assy. to tailstock of lathe and adjust to support outer skin, (Ref.Fig.401).
- (5) Locate parting off tool ref. tool item 2 to tool post of lathe. Place 0.787 in. (20,0 mm) slip gauge against fixture register block (Ref.Fig.401) and set parting tool adjacent.
- (6) Turn to remove outer skin producing 1.380/1.370 in. (35,052/34,798 mm) dimension shown at Fig.403. Special care must be taken as the outer skin is to be re-used.
- (7) Carefully remove the fixture support assy. and outer skin.
- (8) Remove all non-crystalline wax from outside the inner skin.
- (9) Measure dimension Y (Ref.Fig.402) and record, noting this dimension is original.
- (10) Re-locate fixture support assy. to tailstock of lathe and adjust to support inner skin (Ref.Fig.401).

OVERHAUL

- (11) Place 0.787 in. (20,0 mm) slip gauge against fixture register block (Ref.Fig.401) and re-set parting tool adjacent.
- (12) Turn to remove inner skin producing 1.380/1.370 in. (35,052/34,798 mm) dimension shown at Fig.403. Special care must be taken as the fairing support ring is to be re-used.
- (13) Remove fixture support assy. and fixture/support ring assy. from machine, then remove support ring from fixture.
- (14) Remove any burrs produced on the outer skin and support ring.
- (15) View the outer skin and support ring for satisfactory removal (Ref.Fig.403), then identify as set.
- (16) Test the outer skin and support ring for cracks using the fluorescent dye penetrant process specified for this component in 72-21-01, Inspection/Check.

B. Machine Fairing Support Ring.

- (1) Locate support ring to base of fixture ref. tool item 1, (Ref.Fig.401), and locate support ring/fixture assy. to a centre lathe and clock true.
- (2) Turn to produce the location lips for inner and outer skins as shown at Fig.403. Use form tool ref. tool item 3 when turning the outer skin location lip.
- (3) Remove the fixture/component assy. from the lathe and the support ring from the fixture.
- (4) Remove any burrs produced from the support ring.
- (5) Inspect the support ring to ensure the dimensions shown at Fig.403 have been produced.

TN36625

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) Test the support ring for cracks using the fluorescent dye penetrant process specified for this component in 72-21-01, Inspection/Check.

C. Replace Inner Skin.

- (1) Locate the outer skin, removed at para.3.A.(6), to the support ring (Ref.Fig.404). Ensure there is complete seating and alignment. Dress to achieve if necessary using conventional hand tools.
- (2) Measure dimension X (Ref.Fig.402) and record, noting this dimension is post machined.
- (3) Withdraw from stores replacement inner skin B.497500 PMY1.
- (4) Locate replacement inner skin to support ring (Ref. Fig.404). Ensure there is complete seating and alignment. Dress to achieve if necessary using conventional hand tools.
- (5) Measure dimension Y (Ref.Fig.402) and record, noting this dimension is post machined.
- (6) Subtract the original Y dimension (recorded at para.3.A.(9)), from the original X dimension (recorded at para.3.A.(3)), and record as dimension Z.
- (7) Subtract the post machined Y dimension (recorded at para.3.C.(5)), from the post machined X dimension (recorded at para.3.C.(2)), and record as dimension W.
- (8) Subtract dimension W from dimension Z and record as dimension T.
- (9) Locate replacement inner skin on surface table and measure overall height, and record as dimension S.
- (10) Subtract dimension T from dimension S and record as dimension R.

OVERHAUL

- (11) Locate replacement inner skin to machining fixture ref. tool item 4 (Ref.Fig.405).
- (12) Fill inner skin with non-crystalline wax to the extent shown at Fig.405.
- (13) Locate the replacement inner skin/fixture assy. to a centre lathe and clock true.
- (14) Machine the replacement inner skin to an overall height recorded as dimension R (Ref.para.3.C.(10)).
- (15) Remove fixture/component assy. from machine and component from fixture.
- (16) Remove all traces of non-crystalline wax from replacement inner skin.
- (17) Remove all burrs from replacement inner skin.
- (18) Test the replacement inner skin for cracks using the fluorescent dye penetrant process specified for this component in 72-21-01, Inspection/Check.
- (19) Locate the existing outer skin and the replacement inner skin to the location lips on the fairing support ring.
- (20) Inspect to ensure the 0.270/0.230 in. (6,858/5,842 mm) gap exists between the inner and outer skins as shown on Fig.404.
- (21) Polish the mating surfaces of the support ring and the replacement inner skin and locally degrease with Genklene.
- (22) Using welding fixture ref. tool item 5 (Ref.Fig.406), assemble the replacement inner skin to the support ring. Form the mating ends to ensure correct alignment, using conventional forming tools (Ref.Fig.404).

OVERHAUL

- (23) Tackweld, diametrically opposite, the replacement inner skin to the support ring; refer to para.6, process A, for welding data.
- (24) Remove the replacement inner skin/support ring assy. from the fixture.
- (25) Check for correct alignment. If non-alignment exists, then the mating ends must be formed using conventional hand tools to remove any discrepancy. If this is not possible then the tackwelds must be broken to separate the inner skin from the support ring, then after suitable dressing and cleaning the tackwelding procedure repeated.
- (26) Re-locate replacement inner skin/support ring assy. to fixture ref. tool item 5 (Ref.Fig.406), and auto-weld the replacement inner skin to the support ring; refer to para.6, process A, for welding data.

NOTE: Record the final welding parameters used, for use when welding the outer skin in position (Ref.para.D.6).

- (27) Remove the replacement inner skin/support ring assy. from the fixture.
- (28) Check the correct amount of weld protrusion has been achieved. There must be complete penetration, but it must be kept to a minimum. If the weld protrusion is unsatisfactory, and cannot be corrected by a weld re-run then the two parts must be separated by cutting and machining, as detailed previously, and the whole procedure repeated.

NOTE: If a weld re-run is necessary, the fact should be recorded and adjustments made to the welding parameters to ensure it is not necessary when welding the outer skin in position.

- (29) Test the welded area for cracks using the fluorescent dye penetrant process specified for this component in 72-21-01, Inspection/Check.
- (30) Carry out a non-destructive radiological (X-Ray) examination of the welded area.

OVERHAUL

D. Replace Outer Skin.

- (1) Polish the mating surfaces of the existing outer skin and the support ring and locally degrease with Genklene.
- (2) Using welding fixture ref. tool item 6 (Ref.Fig.407), assemble the existing outer skin to the support ring. Form the mating ends to ensure correct alignment, using conventional forming tools (Ref.Fig.404).
- (3) Tackweld, diametrically opposite, the existing outer skin to the support ring; refer to para.6, process A, for welding data.
- (4) Remove the air intake fairing from the fixture.
- (5) Check for correct alignment. If non-alignment exists, then the mating ends must be formed using conventional hand tools to remove any discrepancy. If this is not possible then the tackwelds must be broken to separate the outer skin from the support ring, then after suitable dressing and cleaning the tackwelding procedure repeated.
- (6) Re-locate the air intake fairing to fixture ref. tool item 6 (Ref.Fig.407). Autoweld the existing outer skin to the support ring using the same welding parameters used to weld the inner skin in position. Allowance must be made for the increased diameter.
- (7) Remove the air intake fairing from the fixture.
- (8) Inspect to ensure the 0.270/0.230 in. (6,858/5,842 mm) gap exists between the inner and outer skins as shown on Fig.404.
- (9) Test the welded area for cracks using the fluorescent dye penetrant process specified for this component in 72-21-01, Inspection/Check.
- (10) Carry out a non-destructive radiological (X-Ray) examination of the welded area.

**E. Heat Treat.**

- (1) Heat the air intake fairing, in a vacuum, to 650°C plus/minus 10°C for 30 min. to 1 hour. Cool in argon.

F. Inspect and Identify.

- (1) Test the air intake fairing for cracks using the fluorescent dye penetrant process specified for this component in 72-21-01, Inspection/Check.
- (2) Using the electro-chemical marking or vibro percussion engraving technique, ref.Chapter 72-09-00, Repair, mark on SAL.B.497500 or R2 adjacent the existing part number.
- (3) Finally inspect the air intake fairing to ensure the repair has been carried out satisfactorily and that the air intake fairing is in a serviceable condition.
- (4) Place the air intake fairing in a container and store as required.

ACTION

TITLE: Weld repair of cracked air intake fairing anti-icing exhaust port struts.

APPLICATION: Air intake fairing Pt. No. B458651 IPC Ref 72.21.01-1.10A.

INSTRUCTIONS: (Refer to Sketch on Sheet 2)

N.B. This Repair must only be used once for a maximum of six cracked struts per fairing

1. a) Crack detect fairing using dye penetrant method.
- b) Rout out cracks using a small rotary routing cutter.
- c) Thoroughly clean area to be welded with genklene.
- d) Weld cracks using argon arc process.
 - i) Filler Rod - MSRR 9500/72
 - ii) Current - 25 amps
 - iii) Argon flow rate - 20 cu. ft/HR.
- e) Check weld for satisfactory penetration.

AIR INTAKE FAIRING - REPAIR
PROVISION FOR REPAIR OF CRACKS IN SUPPORT
WEBS BY WELDING

REPAIR NO.B513456

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-21-01	1 10A	B458651

2. Introduction

A. General.

- (1) This repair describes the procedure for the repair of cracks in the support webs of the Air Intake Fairing.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES), in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (4) Remove all sharp edges 0.004 to 0.020 in. (0,10 to 0,50 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in (0,25 mm) unless otherwise stated.

B. Repair Limitations.

- (1) Compliance with all aspects of these repairs should be achieved without deviation. Where a need to deviate is considered necessary, agreement should first be sought from the Repair Authority.
- (2) Any number of cracked supporting webs may be repaired by welding. When repairing all 20 webs, or a large number of webs grouped together, it is important to stagger the repair welds until all defective webs are repaired to minimise the stress of displacement of inner to outer skin.

3. Instructions

A. Preparation.

- (1) Remove damper spring, if fitted, and retain.

REPAIR

72-21-01

Repair No. 3
Page 401
Jun 1/91

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Using rotary burr hand tools only, blend to remove damage. Removing the minimum amount of material, produce a smooth, continuous profile.
- (3) Refer to TSD 594-409, Supplement 12, and TSD 594-101. Thoroughly clean and prepare for welding.

NOTE: Do not use any cleaning materials containing aluminium oxide.

B. Weld.

- (1) Refer to TSD 594-409 (including Supplement 12). Build up defective areas (group 1 weld) using argon arc and filler rods to Omat 3/55, MSRR 9500/72.
- (2) Referring to Figure 401, dress back to original profile without impairing parent material.

NOTE: Remove all sharp edges 0.015 in. (0,38 mm) radius, refer Fig.401.

C. Heat Treat.

- (1) Heat treat to 650°C plus/minus 10°C for 1 hour and cool in argon.

D. Inspect.

- (1) Refer to TSD 594-409, SB 72-8704 and Chapter 72-21-01, Inspect/Check. Carry out X-ray, eddy current and fluorescent dye penetrant crack detection tests at each web location.
- (2) No cracks are permitted.
- (3) Visually inspect for distortion (refer to Figure 401).

E. Reassemble.

- (1) Refer to SB 72-8746-284. Refit existing damper spring or replace if necessary (see para.5., Replacement Parts, of this instruction).

F. Identify.

- (1) Mark the component SAL B513456 adjacent to the existing part number using vibro-percussion engraving marking as specified in Chapter 72-09-00, Repair.

1. Introduction

- A. This Repair describes the procedure for repairing air intake cases which are damaged in excess of the acceptance standards specified in 72-20-00 Inspection/Check. Each location which may be repaired is identified (Ref.Fig.401) by a letter; this letter must be marked, with the repair scheme number, when the location has been repaired.
- B. Refer to 72-09-00 Repair for all standard practices and tolerancing applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

2. Repair Limitations

- A. Cracks which originate at, or cut across the vane stiffening webs must not be repaired by this scheme. Reject the case for repair by vane replacement.
- B. Location A.
 - (1) Weld repair all cracks and tears up to a maximum of four defects per vane and a maximum total length of 8.000 in. (203,200 mm) of repair weld per vane.
 - (2) Weld build-up sharp dents to a maximum depth of 0.125 in. (3,175 mm) and restore profile.

REPAIR

OVERHAUL

- (3) Manipulate any distortion of the leading or trailing edges to within the specified acceptance standard.
- (4) Weld repair gouges up to a maximum size of 0.5 in. (12,70 mm) x 0.25 in. (6,350 mm) and a maximum of four gouges per vane to restore profile.
- (5) Repair all nicks, scores and scratches, which are over half the material thickness in depth, by welding and restore profile.
- (6) Repair all piercing by welding and restore profile.
- (7) No repair weld to be within 1.000 in. (25,4 mm) of vane end fabrication welds.

C. Location B.

- (1) Weld repair all cracks and tears up to a maximum of four defects per intervane space and a maximum total length of 8.000 in. (203,200 mm) of repair weld per intervane space.
- (2) Manipulate dents to within the specified acceptance standard.
- (3) Repair gouges by welding up to a maximum size of 0.5 in. (12,70 mm) x 0.25 in. (6,350 mm) and a maximum of four gouges per intervane space.
- (4) Repair all nicks, scores and scratches, which are over half the material thickness in depth, by welding and restore profile.
- (5) Repair all piercing by welding and restore profile.
- (6) No repair weld to be within 1.000 in. (25,4 mm) of vane end fabrication welds.

D. Location C.

- (1) Weld repair all cracks and tears up to a maximum of four defects per intervane space and a maximum total length of 8.000 in. (203,200 mm) of repair weld per intervane space.

- (2) Manipulate dents to within the specified acceptance standard.
- (3) Repair gouges by welding up to a maximum size of 0.5 in. (12,70 mm) x 0.25 in. (6,350 mm) and a maximum of four gouges per intervane space.
- (4) Repair all nicks, scores and scratches, which are over half the material thickness in depth, by welding and restore profile.
- (5) Repair all piercing by welding and restore profile.
- (6) No repair weld to be within 1.000 in. (25,4 mm) of vane end fabrication welds.

3. Summary of Operations

A. Prepare Location A.

- (1) Vee-groove cracks for their full length and clean out dents.
- (2) Test for cracks by the fluorescent penetrant process specified for this component in 72-20-00 Inspection/Check.
- (3) Prepare areas for welding by abrading with Scotch-brite and swabbing with acetone.
- (4) Clean the inner surface of vanes in areas to be welded.
- (5) Blank off vane ends with tape to ensure retention of inert gas during welding.

B. Prepare Locations B and C.

- (1) Dress as required to remove dents.
- (2) Dress to restore profile around pierced sections.
- (3) Vee-groove cracks for their full length and clean out dents.

REPAIR

72-22-01

OVERHAUL

- (4) Test for cracks by the fluorescent penetrant method specified for this component in 72-20-00 Inspection/Check.
 - (5) Prepare areas for welding by abrading with Scotchbrite and swabbing with acetone.
 - (6) Clean the underside of areas to be welded.
- C. Inspect the case and pass for welding.
 - D. Plasma arc weld to build up the defective locations; use filler rods to specification MS 950/72.
 - E. Dress repairs at location A to restore the vane profile.
 - F. Dress welds at locations B and C flush with the material surface on both sides; use a non-abrasive cutter.
 - G. Repeat the test for cracks.
 - H. Inspect the case and identify areas to be examined by X-ray.
 - J. Examine by X-ray the areas identified by the inspection authority.
 - K. Heat Treat Case.
 - (1) Heat the case to 475 deg C (plus/minus 5 deg C) and soak at this temperature for four hours.
 - (2) Cool the case in air.
 - L. Repeat the test for cracks.
 - M. Inspect the case to verify that all repairs are satisfactory.
 - N. Identify Repairs.
 - (1) Mark the repair scheme number followed by the identification letters (Ref.Fig.401) of each repaired location i.e. SAL B.488695A/B/C.

TN41573

OLYMPUS 593

MK.610-14-28

OVERHAUL

(2) Lightly mark the letter W close to each end of all repair welds.

P. Finally inspect the air intake case.

4. Special Tools, Fixtures and Equipment

A. Not required.

5. Replacement Parts

A. Not required.

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

Vanes must only be removed singly or in non adjacent pairs and must be replaced before removal of other vanes.

3. GENERALUNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimetres)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 125 (3,2) Microinches (Micrometres)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

4. REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

- 1) Visually inspect air intake case to ascertain position and part number of defective vane(s). Refer fig.401
- 2) Remove and discard 18 off self locking shank nuts from rear flange of inner case. Refer fig.402
Refer Overhaul Manual
Chapter 72-09-00 Repair
- 3) Install air intake case in clamping and welding fixture. Ref para.7. TOOLS, item 1.
- 4) Cut through defective vane close to existing inner case /vane weld line. Use conventional hand tools. Refer fig.403
- 5) Install clamping and welding fixture/air intake case on bed of jig boring machine. Secure with vane end positioned relative to machine spindle.
- 6) Machine out defective vane end to existing weld lines producing required aperture in air intake outer case. Use suitable drill and milling cutter. Refer figs.403 and 404
- 7) Remove and discard defective vane sub unit.
- 8) Remove clamping and welding fixture/air intake case from jig borer.
NOTE: Do not remove air intake case from clamping and welding fixture.
- 9) Dress corners of machined aperture in air intake outer case to produce 90 degree angles. Remove burrs and sharp edges from machined area using conventional hand tools. Refer fig.404

PRINTED IN ENGLAND

- 10) Machine or hand dress back vane stub to existing inner case/vane weld line. Remove burrs and sharp edges using conventional hand tools. Refer fig.403
- 11) Dimensionally inspect machined aperture in outer case to ensure that required dimensions have been achieved. Ref figs.403 and 404
- 12) Crack detect areas surrounding outer case machined aperture and vane stub. Refer Overhaul Manual Chapter 72-20-00 Inspection/Check
- 13) Withdraw new restrictor plate, vane and vane end, as required from stores. Ref para.8. REPLACEMENT PARTS, items 6-10.
NOTE: Restrictor plate item 9, is fitted in vanes 1 and 5. Restrictor plate item 10, is fitted in vane 2. Vanes 3 and 4 have no restrictor plate fitted.
- 14) Assemble appropriate restrictor plate to vane and resistance spot weld in position (vanes 1, 2 and 5 only). Use four spot welds each side of vanes 1 and 5, five spot welds each side of vane 2. Refer figs.407 and 408
Refer para.6.A. DATA.
Refer TSD 594 OP.403.
- 15) Locate vane in filing/tack welding fixture and dress the outer end of the vane to size. Refer para.7. TOOLS, item 2.
- 16) Locate vane end to the table of a milling machine, and machine to produce dimensions specified. Refer figs.405 and 406
- 17) Chamfer the mating surfaces of the vane and vane end to 60/62 degrees. Polish the mating surfaces using clean fine grade abrasive matt and locally degrease with approved solvent. Take care not to touch prepared surfaces prior to welding. Refer fig.415
Refer TSD 594 OP.101 and 409
OMat 583

OVERHAUL

- 18) Using welding fixture assemble the replacement vane to the replacement vane end. Form the mating ends to ensure correct alignment using conventional hand tools. Ensure any mismatch does not exceed the limits shown in figure 416. Refer fig.416
- 19) Starting at the mid point of the concave and convex sides and alternating from side to side in a diagonally opposite sequence tackweld the replacement vane to the replacement vane end. Refer fig.405
Use the T.I.G welding technique detailed in TSD 594 OP.409 in conjunction with data specified in para.6.B. DATA, process B1.
Alternatively, use the plasma welding technique detailed in Overhaul manual, Chapter 72-09-12 Repair in conjunction with data specified in para.6.B. DATA, process B2.
- 20) Remove the replacement vane/vane end assy from the fixture.
- 21) Check to ensure no excessive mismatch exists. If excessive mismatch does exist, then the mating ends must be formed using conventional hand tools to remove any discrepancy. If this is not possible then the tackwelds must be broken to separate the vane and vane end, then after suitable dressing and cleaning the tackweld procedure repeated.
- 22) Weld the replacement vane to the vane end, by joining two tacks at the mid point of the convex side, followed by two tacks at the mid point of the concave side, then alternate from side to side in a diagonally opposite sequence, joining two tacks each time. Refer fig.405
Use the T.I.G welding technique detailed in TSD 594 OP.409 in conjunction with data specified in para.6.B. DATA, process B1.
Alternatively, use the plasma welding technique detailed in the Overhaul Manual, Chapter 72-09-12 Repair in conjunction with data specified in para. 6.B. DATA, process B2.

MK.610-14-28
OVERHAUL

- 23) Check for suitable weld penetration. If the weld penetration is unsatisfactory and can not be corrected by a weld re-run then the two parts must be separated, and the whole procedure repeated.
- 24) Visually inspect vane sub unit to ensure acceptable welding.
- 25) Crack detect welded areas of vane sub unit. Refer Overhaul Manual Chapter 72-20-00 Inspection/Check
- 26) Carry out radiological examination of vane sub unit. Refer TSD 594 OP.409. Refer Appendix A.
- 27) Locate the vane sub unit in the filing/tackwelding fixture, and dress the inner end of the vane to length. Ref para.7. TOOLS, item 2.
- 28) Chamfer the mating surfaces of the vane sub unit and the vane stub on the inner case to 60/62 degrees. Polish the mating surfaces using clean fine grade abrasive matt and locally degrease with approved solvent. Take care not to touch prepared surfaces prior to welding. Refer fig.415. Refer TSD 594 OP.101 and 409. Use OMat 583
- 29) Set vane sub unit in position in air intake case and in fixture adjusting bracket. Refer para.7. TOOLS, item 1.
- 30) Adjust position of vane sub unit relative to air intake case; use adjusting screws on adjusting bracket of fixture. Form the mating ends to ensure correct alignment using conventional hand tools. Refer fig.416 Refer para.7. TOOLS, item 1.
Ensure any mismatch does not exceed the limits detailed in figure 416.

APPENDIX ARADIOGRAPHIC INSPECTION OF E.B.W WELDS.

1. Defects shall be assessed to the following standard.

<u>ITEM</u>	<u>DEFECT</u>	<u>ASSESSMENT</u>
1.1	Cracks	Not acceptable
1.2	Lack of penetration	Not acceptable
1.3	Lack of fusion	Not acceptable
1.4	Undercutting-sharp edged	Not acceptable
1.5	Inclusions	Not acceptable
1.6	Weld concavity	Refer fig.417
1.7	Porosity	Refer paras.2 and 3
1.8	Edge of weld concavity	Refer fig.417
1.9	Cavitation	Not acceptable

2. Randomly dispersed porosity.

- 2.1. Acceptable pores must be of a spherical nature; sharp, irregular pores are not acceptable.

- 2.2. The number and spacing of maximum diameter randomly dispersed pores in any 6.000 (150,00) length of weld shall be as shown in table 1.

A larger number of smaller diameter pores are acceptable provided the spacing ratio is maintained and the total area does not exceed the equivalent standard.

MATERIAL THICKNESS (refer para.2.5)	MAX DIA OF PORES (D)	MAX No OF PORES (N)	MIN DISTANCE BETWEEN PORES
Under and including 0.060 (1,50)	0.012 (0,30)	12	10 x D
Over 0.060 (1,50) to 0.120 (3,00)	0.024 (0,60)	12	6 x D
Over 0.120 (3,00) to 0.240 (6,00)	0.040 (1,00)	10	5 x D
Over 0.240 (6,00) to 0.480 (12,00)	0.040 (1,00)	10	3 x D

PRINTED IN ENGLAND

- 2.3. For welds less than 6.000 (150,00) in length, the number of pores (N) acceptable shall be proportional to the length (L) of the weld ie.

$$\frac{N \times L}{6} \text{ ins} \quad \text{OR} \quad \frac{N \times L}{150} \text{ mm}$$

- 2.4. The sum of the diameters of all pores (including chain porosity) in any 2.000 (50,00) length of weld shall not exceed 0.240 (6,00).
- 2.5. Acceptance levels should be based on material thickness at the time of welding, taking into account any further machining of the welded joints, since this may bring their assessment into a lower material thickness range.
3. Porosity forming a chain on thickness's over 0.060 (1,50).
- NOTE: Chain porosity on thickness's up to and including 0.060 (1,50) is not acceptable.
- 3.1. Acceptable pores must be of a spherical nature; sharp, irregular pores are not acceptable.
- 3.2. Chain porosity less than 0.010 (0,25) diameter is acceptable provided there is a minimum of 0.010 (0,25) between individual pores and 0.050 (1,25) between parallel lines of porosity. The sum of the diameters of the pores in any 1.000 (25,40) length of weld must not exceed 0.240 (6,00).

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

This Repair Instruction may be embodied any number of times provided that the minimum residual wall thickness dimensions stated in figs. 402 to 405 are maintained.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)
Dimensions in Inches (Millimetres)
Tolerances on machined dimensions plus/minus 0.010 (0,25)
Tolerance on angles plus/minus 2 degrees
Break sharp edges 0.004 to 0.020 (0,1 to 0,5)
Surface texture interpretation to ISO1302 (JES137)
Surface texture to be 125 (3,2) Microinches (Micrometres)
Welding symbols to ISO2553 (JES139)
3rd Angle Projection

4. REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

- 1) Using hand tools only (no power tools permitted), carefully blend to remove cracking. Remove the minimum amount of material necessary. Polish to restore surface finish.

Refer figs 401 to 405.
Refer para.2. REPAIR LIMITATIONS.
Refer para.6. DATA.

CAUTION: If during metal removal, blending or polishing, the material exhibits discolouration due to local overheating, the component must be referred to the local controlling laboratory for assessment by etching and metallurgical examination.

- 2) Dimensionally inspect to ensure minimum wall sections have been maintained at stations A to E. Refer fig.401 to 404.

NOTE: At points between stations, minimum wall sections may vary proportionately to the adjacent station limitations, relative to the axial distance from them.

- 3) Locally etch repaired area(s). Refer Overhaul Manual Chapter 72-09-14 Repair Solution A.
- 4) Locally crack detect repaired area(s). Refer TSD 594 OP 210.
- 5) Mask areas of vane end outer platform not requiring vapour blasting. Use masking tape OMat 230 and/or mechanical blanking plates.
- 6) Locally vapour blast etched area(s). Refer Overhaul Manual Chapter 72-09-13 Repair Procedure B.
- 7) Remove masking.
- 8) Mark Repair Instruction number RI B514696 or R3 on component adjacent to normal 'assy of' no. using the vibro-percussion engraving technique. Refer Overhaul Manual Chapter 72-09-00 Repair.

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

Temporary Revision No. 72-533

Insert in 72-22-01 at rear of repair section in RST No. order.

REASON FOR ISSUE:

To introduce a repair to restore seal clamp dimensions (MRA 101)

ACTION

B.E.O.L.

RST 4018 SEAL CLAMPS:-
WELD BUILD UP CONTACT FACE

PROCEDURE

In order to restore seal clamps that fail to meet the required 'nip check' it is permissible to repair as follows:-

1. Build up contact face by Argon Arc weld using Jethete M.190 filler rod (MSRR 9500/10) weld to T.S.D. 594-409.
2. Heat treat at $650^{\circ}\text{C} \pm 10^{\circ}\text{C}$ for 30 minutes, air cool.
3. Machine to restore the 0.27" dimension.
4. Hand dress to blend in with existing inside and outside form.
5. Inspect to the M1 or F1 process as per overhaul manual.

NOTE: The above is in accordance with Oly/Sedp/291 and Oly/Sedp/475.

LP COMPRESSOR FRONT BEARING SUPPORT - REPAIR
NO.1 BEARING HOUSING SEAL LAND REPAIRED
BY APPLICATION OF ABRADABLE COATING

Applicable to: Bearing Housings B.925463, B.925464
Authority: Modification No. OL.8360C

1. Introduction

- A. This Repair describes the procedure for restoring the No.1 bearing housing labyrinth ring seal land, in order to maintain the standard fin/ring clearances of labyrinth No.1. The defective location is first built up with an abradable coating then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the spraying processes applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

2. Repair Limitations

- A. There is no restriction on the number of times this repair may be applied, provided that specified dimensions are maintained.
- B. Verify that there is adequate material at the defective location to permit machining to the dimensions before spraying (Ref.para.3.B.).

3. Summary of Operations

- A. Set the housing true (Ref.Fig.401).
- B. Machine the seal land to the specified dimensions (Ref.Fig.403).
- C. Crack test the housing with fluorescent-penetrant.

- D. Apply Abradable Coating (Ref.Fig.404).
- (1) Combustion spray the prepared seal land with a bond coating of Metco 450NS, 0.003 in./0.005 in. (0,076 mm/0,127 mm) in thickness.
 - (2) Flame spray Sherritt-Gordon 75/25 Nickel/Graphite abradable coating or Metco 313NS 0.030 in. (0,762 mm) in thickness over the bond coating.
- E. Finish machine the seal land (Ref.Fig.402).
- F. Visually inspect the repair for integrity of the sprayed coating and continuity of sprayed edges.
- G. Mark the coating identification symbols, Sherritt-Gordon and or Metco and as applicable, using the electro-chemical or vibro-percussion marking technique detailed in 72-09-00 Repair.
- H. Identify repair. Mark the repair scheme number SAL B.470383 close to the standard part number on the housing.

LABYRINTH HOUSING SEAL LAND REPAIRED
BY APPLICATION OF ABRADABLE COATING

Applicable to: Labyrinth Housings B.454520, B.484244

Authority: Modification No. OL.8360C

1. Introduction

- A. This Repair describes the procedure for restoring the labyrinth housing seal land, in order to maintain the standard fin/housing clearances of labyrinth No.2. The defective location is first built up with an abradable coating then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the spraying processes applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

2. Repair Limitations

- A. There is no restriction on the number of times this repair may be applied, provided that specified dimensions are maintained.
- B. Verify that there is adequate material at the defective location to permit machining to the dimensions before spraying (Ref.para.3.B.).

3. Summary of Operations

- A. Set the labyrinth housing true on datum diameter B and flange face A (Ref.Fig.402).
- B. Machine the seal land to the specified dimensions (Ref.Fig.402).
- C. Crack test the labyrinth housing with fluorescent-penetrant.

LP COMPRESSOR FRONT BEARING SUPPORT - REPAIR
NO.1 BEARING HOUSING REPAIRED BY FITTING REPLACEMENT
LABYRINTH HOUSING

Applicable to:

Bearing Housings B.925465,
B.925466

Authority:

Modification No. OL.8420C

1. Introduction

- A. This Repair describes the procedure for fitting a replacement labyrinth housing to the No.1 bearing housing, in order to maintain the standard fin/housing clearances of labyrinth No.1.
- B. Refer to Chapter 72-09-00, Repair for all standard practices and tolerancing applicable to this repair procedure.
- C. Dimensions are shown thus on illustrations: INCHES (MILLIMETRES).
- D. Maching surface texture, unless otherwise stated, to be 125 MICROINCHES (3,2 MICROMETRES).

2. Summary of Operations

- A. Prepare Housing for Repair.
 - (1) Remove and discard the nine shank nuts from the housing flange; the procedure is described in 72-09-00, Repair.
 - (2) Extract and discard the thirty-one wire-thread inserts from the flange; the procedure is described in 72-09-00, Repair.
- B. Remove Defective Labyrinth Housing.
 - (1) Mount the bearing housing by its large flange face on the faceplate of a centre-lathe; set true on the internal diameter (Ref.Fig.401).

REPAIR

72-23-01

Repair No.3

Page 401

Jun 1/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Cut off the defective labyrinth and dress back to the specified dimension (Ref.Fig.401).
- (3) Remove all burrs and sharp edges.
- (4) Inspect the component for satisfactory completion of all previous operations.
- (5) Test the housing for cracks by the magnetic particle crack detection method Ref.72-23-01, Inspection/Check. Data specific to this Repair is given on the diagram (Ref.Fig.402).

C. Fit Replacement Labyrinth Housing.

- (1) Manufacture test pieces for setting the electron beam welding equipment; use material to Rolls-Royce specification MSRR 6503.
- (2) Locate the test pieces in the fixture (item 2); electron beam weld the test pieces and submit with the essential welding data, to the controlling laboratory for approval.
- (3) Examine the replacement component and ensure that it is undamaged.
- (4) Locate the bearing housing, with its smaller diameter uppermost, in the fixture (item 2); position the E.B.W. shield in the housing under the area to be welded.
- (5) Electron beam weld the labyrinth housing to the bearing housing (Ref.Fig.402).
- (6) Inspect the repair to ensure that the assembly is satisfactory. Examine the repair weld by the radiographic (X-ray) method and repeat the test for cracks.
- (7) Heat treat the unit.
 - (a) Heat the unit to 650°C (plus/minus 10°C) and soak at this temperature for one hour.
 - (b) Air cool the unit.
- (6) Repeat the test for cracks.

D. Finish Machine Housing.

- (1) Remount the housing by its large flange face on the centre-lathe faceplate; set true on the internal diameter (Ref.Fig.401).

TN829

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Turn the bore of the new labyrinth housing to 4.305 in./4.315 in. (109,35 mm/109,60 mm) diameter.

NOTE: This leaves an allowance for final grinding.

- (3) Mount the housing by its large flange face on the faceplate of an internal grinder; set true on the internal diameter (Ref.Fig.401).

- (4) Finish grind the bore and chamfer the labyrinth housing to the specified dimensions (Ref.Fig.403).

- (5) Remove all burrs and sharp edges.

- (6) Inspect for satisfactory completion of previous operations.

- (7) Repeat the test for cracks.

E. Assemble the new wire-thread inserts to the housing flange; ensure that the inserts are 1 to 1½ turns below the surface of the flange. The correct installation procedure is described in 72-09-00, Repair.

F. Assemble the new shank nuts to the housing flange; use the swaging tool (Item 1). The correct installation procedure is described in 72-09-00, Repair.

G. Inspect for correct fitting of wire-thread inserts and shank nuts; ensure that all wire-thread insert tangs have been removed.

H. Identify repair. Mark the repair scheme number SAL B.909985 close to the standard part number on the component.

SNECMA

1. Introduction

- A. This Repair describes the procedure for fitting standard replacement labyrinth rings to the vane fixing rings in order to maintain the standard labyrinth ring/fin clearances.
- B. Refer to Chapter 72-09-00, Repair for all standard practices and tolerancing applicable to this repair procedure.
- C. Dimensions are shown thus on Figure 401 and in Table 401: INCHES (MILLIMETRES).

2. Summary of Operations

A. Remove the Defective Labyrinth Ring.

- (1) Remove the nuts, bolts and retaining plates from the assembly; retain these items for the re-assembly procedure.
- (2) Remove the defective labyrinth ring; use the extractors (items 1-7). Take care to avoid damage or distortion to the fixing ring; discard the labyrinth ring.
- (3) Inspect the bore B of the stator fixing ring against the appropriate dimensions (Ref.Fig.401 and Table 401).
- (4) Crack test the stator fixing ring by the fluorescent penetrant process specified for this component in 72-31-01, Inspection/Check.

B. Fit Replacement Labyrinth Ring.

NOTE: Use the correct setting tool (Ref.para.3).

- (1) Select the correct labyrinth ring for the stage to be repaired.
- (2) Heat the stator fixing ring to 220 deg C.
- (3) Assemble the new labyrinth ring to the stator fixing ring.

NOTE: Maintain the setting dimension C specified for the stage (Ref.Fig.401 and Table 401).

- (4) Allow the assembly to cool.
 - (5) Re-assemble the bolts, nuts and retaining plates. Use lubricant B (Ref.72-09-00 Assembly Table 501) on the threads and torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
 - (6) Inspect the assembly to verify that the labyrinth ring has been fitted correctly.
 - (7) Repeat the test for cracks.
- C. Identify repair (Ref. Table 401). Mark the appropriate repair scheme number close to the standard number on the assembly.

2. Authority: Modification No. OL.8462C

3. Introduction

- A. The text and Fig.401 of this Repair defines the blending procedure (SAL B.930280) applicable to all LP compressor stator vanes and must be read in conjunction with the specific data for each stage of vanes given in Table 401 and Fig.402.
- B. Refer to 72-09-00 Repair for all standard practices applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

NOTE: Blended vanes must be reassembled spaced evenly around the stage.

OVERHAUL

4. Instructions

A. General.

- (1) Test vanes for cracks, before and after blending, by the fluorescent dye process specified for the vanes in 72-31-01 Inspection/Check; reject cracked vanes.
- (2) Vanes with dents which deform the opposite surface of the vane are not acceptable for blending; reject vanes with this form of damage.
- (3) A blend in one zone can run out into the adjacent zone even if it infringes the blend limit for that zone, except at zone X on stages 1 and 2.

B. Procedure.

- (1) Crack test vanes to determine full extent of damage. Refer to the fluorescent dye process specified for the blades in 72-33-01 Inspection/Check.
- (2) Dress to remove damage.

CAUTION: IF MECHANICAL BLENDING METHODS ARE USED,
ENSURE THAT VANES ARE NOT OVERHEATED.

- (a) Polish acceptable surface dents (Ref. para.4.(2)) to remove burrs.
- (b) Blend torn, rough or scored edges to a depth 20 per cent greater than the depth of damage, provided that specified limits are not exceeded.
- (c) If adjacent blends interfere, remove material from between them to produce a coupled blend.
- (d) Profile edge blends smoothly into the aerofoil shape (Ref.Fig.401).
- (e) Polish blends and defective areas.

British airways

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION No. 72-514

Insert in 72-31-01 Repair 2 before page 403

REASON FOR ISSUE:

To discontinue on British Airways engines only, the post dressing procedures on L.P. compressor vanes stages 1, 2, 3 and 6. as quoted in the Rolls-Royce repair procedure No.2. (MRA 70).

ACTION

Delete paragraphs B(5) Etch the vanes and B(7) Vapour blasting.

NOTE: Only applicable to British Airways engines.

OLYMPUS 593

MK.610-14-28

OVERHAUL

SEE TR

- (f) Remove only the minimum amount of material consistent with specified requirements and dimensions.
- (g) In zone X, blending is permitted only as defined in (i) and (ii).
- (i) Blend light nicking of the edges.
- (ii) Polish out light surface scratches.
- (h) For opposing blends the chordal width must not be reduced by more than dimension D or E, as applicable.
- (j) Blending and polishing marks must be only in a radial direction, from root to tip.
- (k) Blend and polish to a surface finish of 32 MICROINCHES (0,8 MICROMETRES).
- (3) Clean vanes by the process specified for the vanes in 72-31-01 Cleaning.
- (4) Vapour degrease the vanes.
- CAUTION: OBSERVE THE RESTRICTION ON THE PERIOD OF IMMERSION FOR TITANIUM COMPONENTS (REF. 72-09-00 CLEANING).
- (5) Etch the vanes (Ref.72-09-14 Repair).
- (a) Use Solution A.
- (b) Mask the vane roots and other areas not to be etched, with I.C.I. Stopping-Off Red Lacquer F230-2006.
- (c) Etch the vanes for the minimum time required to achieve the desired surface for inspection, up to a maximum period of 20 seconds after the onset of gassing.

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (d) Remove the masking lacquer by swabbing with trichloroethane to the approved specification (Ref.72-09-00 Cleaning).
- (6) Repeat the test for cracks.
- (7) Vapour blast blended vanes (Ref.72-09-13 Repair).
 - (a) Apply masking tape to the vane roots and other areas which are not to be blasted.
 - (b) Vapour blast vanes to the Parameters for Procedure A and Special Details for Blades and Vanes specified in the vapour blasting procedure.
 - (c) Remove masking tape from the vanes.
- 5. Assessment of Amount of Blending per Vane (All Stages)
 - A. Vanes may be blended in several positions provided that the total extent of blending is not more than the equivalent of two blends to the maximum in zone Z.
 - B. Depth of blending is controlled by zones.
 - C. The maximum permissible number of blended vanes per stage, when blended to maximum limits, is identified as L (Ref. Table 401).
 - D. Where vanes are not blended to the permissible maximum, this number (Ref. para. (C)) may be increased, provided that the aggregate of the blending does not exceed L.
 - E. Permissible blending is controlled by depths; example for stage 1 vane:
 - (1) 0.250 in. (6,35 mm) depth x two blends = 0.500 in. (12,70 mm) total = maximum blended vane.
 - (2) This maximum may be obtained as defined in (a), (b) or (c), or by any combination of depths the total of which does not exceed 0.500 in. (12,70 mm).
 - (a) 0.125 in. (3,175 mm) depth x four blends.
 - (b) 0.100 in. (2,54 mm) depth x five blends.
 - (c) 0.050 in. (1,27 mm) depth x ten blends.

TN14138

OLYMPUS 593

MK.610-14-28

OVERHAUL

F. One coupled blend = two blends.

6. Assessment of Blending Equivalent to L Number of Blended Vanes per Stage

A. Example for stage 1 vane:

- (1) L = four vanes x 0.500 in. (12,70 mm) depth = 2.000 in. (50,80 mm) aggregate depth.
- (2) This aggregate may be obtained as defined in (a), (b) or (c), or by any aggregate of blended vanes which does not exceed 2.000 in. (50,80 mm).
 - (a) 0.400 in. (10,16 mm) depth x five vanes.
 - (b) 0.200 in. (5,08 mm) depth x ten vanes.
 - (c) 0.150 in. (3,81 mm) depth x thirteen vanes.

7. Identify Repair (Ref. Table 401)

A. Mark the repair scheme number, appropriate to the stage of vanes, close to the standard part number on the vanes (Ref.72-09-00 Repair).

NOTE: Do not mark the number of this scheme SAL B.930280 on the vanes.

8. Special Tools, Fixtures and Equipment

A. Not required.

9. Replacement Parts

A. Not required.

OVERHAUL

- (2) Dimensions are shown thus, INCHES (MILLIMETRES) in tables and illustrations.
- (3) Refer to Chapter 72-09-00 Repair for all standard practices applicable to this repair procedure.
- (4) Remove all sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (6) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (7) Place the component in a suitable container for protection against damage during transit between operations.
- (8) All tools referred to by item number in procedural steps are detailed in para.4.

3. Instructions

A. Remove Flame Deposition Coating.

- (1) Remove the flame deposition coating from the inner abutment faces (Ref.Fig.401), following the procedure detailed in 72-09-25, Repair, using process F.
- (2) Inspect the inner abutment faces to ensure complete removal of flame deposition coating.

B. Grind Inner Abutment Face (Convex Side).

- (1) Locate the vane to its relevant fixture (Ref. Table 401 and Fig.402).

E. Detonation Flame Spray.

- (1) Detonation flame spray the inner abutment faces AK (Ref.Fig.404) using LWIN40, 0.008/0.010 in. (0,20/0,25 mm) thick, following the procedure detailed in 72-09-26. No flame deposition at AJ, and overspray only permissible where shown (Ref.Fig.407).

NOTE: The inner abutment faces will not be machined after spraying.

- (2) Inspect to ensure complete coverage of coating to the correct thickness.

F. Produce Radii.

- (1) Using standard hand tools produce radii AG as shown on Fig.407.

G. Inspect and Identify.

- (1) Test the vane for cracks using the fluorescent dye penetrant process specified for this component in 72-31-01 Inspection/Check.
- (2) Using the vibro-percussion engraving technique, Ref.72-09-00, Repair, mark SAL. B.497490-5 or R3 adjacent the existing part number.
- (3) Finally inspect the vane to ensure the repair has been carried out satisfactorily and that the vane is in a serviceable condition.

OVERHAUL

2. Introduction

A. General.

- (1) This repair describes the procedure for restoring the inner abutment faces by weld build-up and the application of a flame deposition coating.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES) in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair for all standard practices applicable to this repair procedures.
- (4) Remove all sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (6) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (7) Place the component in a suitable container for protection against damage using transit between operations.
- (8) All tools referred to by item number in procedural steps are detailed in para.4.

B. Repair Limitations.

- (1) If wear of the inner abutment faces encroaches on the aerofoil fillet radii, do not attempt to repair vanes using this process.

3. Instructions

A. Remove Flame Deposition Coating.

- (1) Remove any flame deposition coating from the inner abutment faces (Ref.Fig.401), following the procedure detailed in Chapter 72-09-25, Repair, using process F.

OLYMPUS 593

MK.610-14-28

OVERHAUL

B. Inspect.

- (1) Inspect the inner abutment faces to ensure complete removal of flame deposition coating.
- (2) Inspect the vanes for cracks using the fluorescent dye penetrant process detailed for this component in Chapter 72-31-01, Inspection/Check.

C. Mark Out.

- (1) Indicate the areas to be welded using temporary marking (Ref.72-09-00, Assembly).

D. Weld (Convex Side).

- (1) Clamp the appropriate welding chill to the vane (Ref. Table 401 and Figure 402).

Vane Stage	Welding Chill
1	Tool item 1
2	Tool item 2
3	Tool item 3
4	Tool item 4
5	Tool item 5
6	Tool item 6

Welding Chills
Table 401

- (2) Build up the worn convex inner abutment face by tungsten inert gas (TIG) arc welding using filler rod MSRR 9500/73. The area must be built up sufficiently to allow for final machining.

- (3) Remove the chill.

E. Inspect.

- (1) Inspect the welded area to ensure satisfactory completion of the previous operation.
- (2) Inspect the vane for cracks using the fluorescent dye penetrant process detailed for this component in Chapter 72-31-01, Inspection/Check.

Inspection Fixtures
Table 404

- (3) Etch inspect the vane using the procedure detailed in Chapter 72-09-14, Repair. Use solution A.
- (4) Inspect the vane for cracks using the fluorescent dye penetrant process detailed for this component in Chapter 72-31-01, Inspection/Check.

M. Vapour Peen.

- (1) Peen the vane using the wet glass bead peening process detailed in Chapter 72-09-15, Repair.

N. Detonation Flame Spray.

- (1) Detonation flame spray the inner abutment faces 0.010/0.008 in. (0,25/0,20 mm) thick, using LWIN40 coating. Refer to 72-09-26 for flame deposition procedure. Flame deposition is not permissible at AJ, and overspray is only permissible where shown (Ref.Fig.405).

P. Produce Radii.

- (1) Produce radii (AG) on abutment faces as detailed in Chapter 72-31-01, Repair No.3.

Q. Inspect.

- (1) Inspect for the satisfactory completion of the previous operations.

5. Replacement Parts

A. Not required.

British airways

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

Temporary Revision No. 72-581
Insert in 72-31-01 at rear of repair section

REASON FOR ISSUE:

To re-issue BEOL repair RST 4026 previously issued as TR.72-542 and to add repair reference issued by LHR (Ref TIS CONC 417)

ACTION

Reference Bracket Pt. No.B480808.

- A. Repair Scheme 71-41431 - To repair a broken lug. Drawing required: 4BA82041.
- B. BEOL Repair RST 4026. Bracket; Plate Mounting. To repair or replace a lug by welding.

This Repair Scheme is in two parts:-

PART 1: Covers a cracked lug which may be welded and dressed back to original contours.

PART 2: Covers the replacement of a broken lug.

PART 1

1. Cold straighten lug to original position by using new mounting assembly and Fig. 1. to obtain shape.
2. Clean and prepare crack area for welding in accordance with TSD.594/407.
3. Argon arc weld crack using filler rod MSRR.9500/2 as per TSD.594/407.
4. Crack detect as per Standard Practices Manual 72-20-10.
5. Dress lug back to original contours as per Fig. 1.
6. Visually inspect.
7. Vibro engrave RST 4026/1 adjacent to Part Number.

British airways
CONCORDE

TR.NO. 72-581 (cont'd)

PART 2

1. Hand dress repair area to remove sharp edges.
2. Manufacture a suitable lug, using MSRR.6523 sht. - 0.033/0.039" thick, as per Fig. 2, or new bracket assembly.
3. Prepare surfaces for welding as per TSD.594, Op. 407.
4. Argon arc tack weld lug into position, in two places, as shown in Fig. 2, using filler rod MSRR.9500/2, as per TSD.594, Op. 407.
5. Resistance weld lug in three places, as shown in Fig. 2. as per TSD.594, Op. 403.
6. Crack detect as per TSD.594, Op. 203.
7. Drill hole and hand dress lug to conform to shape of Fig. 1. dimensions.
8. Visually inspect.
9. Vibro engrave RST 4026/2 adjacent to Part Number.

British airways

LP COMPRESSOR EXIT GUIDE CASE AND VANES - REPAIR
BLENDING AND POLISHING DAMAGED VANES WITH
CONTROL ON NUMBER OF BLENDED VANES
(SCHEME NO. B.930279-80 - EXIT GUIDE VANES)

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Stage</u>	<u>Part Numbers up to and including Mod.No.</u>
72-31-02	01 90, 100, 110, 120	E.G.V.	OL.8462

2. Authority: Modification No. OL.8462C.

3. Introduction

- A. The text and Fig.401 of this Repair defines the blending procedure (SAL B.930280) applicable to all LP compressor exit guide vanes and must be read in conjunction with the specific data given on Fig.402.
- B. Refer to 72-09-00 Repair for all standard practices applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

NOTE: Blended vanes must be reassembled spaced evenly around the stage.

4. Instructions

A. General.

- (1) Test the vanes for cracks, before and after blending, by the fluorescent dye process specified for the vanes in 72-31-02 Inspection/Check; reject cracked vanes.
- (2) Vanes with dents which deform the opposite surface of the vane are not acceptable for blending; reject vanes with this form of damage.

REPAIR

Nov 1/76

PRINTED IN ENGLAND

TN27201

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (3) A blend in zone Z must not run out into zone X.

B. Procedure.

- (1) Crack test vanes to determine full extent of damage. Refer to the fluorescent dye process specified for the vanes in 72-31-02 Inspection/Check.
- (2) Dress to remove damage.

CAUTION: IF MECHANICAL BLENDING METHODS ARE USED,
ENSURE THAT VANES ARE NOT OVERHEATED.

- (a) Polish acceptable surface dents (Ref. para.4.(2)) to remove burrs.
- (b) Blend torn, rough or scored edges to a depth 20 per cent greater than the depth of damage, provided that specified limits are not exceeded.
- (c) If adjacent blends interfere, remove material from between them to produce a coupled blend.
- (d) Profile edge blends smoothly into the aerofoil shape (Ref.Fig.401).
- (e) Polish blends and defective areas.
- (f) Remove only the minimum amount of material consistent with specified requirements and dimensions.
- (g) In zone X, blending is permitted only as defined in (i) and (ii).
- (i) Blend light nicking of the edges.
- (ii) Polish out light surface scratches.
- (h) For opposing blends the chordal width must not be reduced by more than dimension D.
- (j) Blending and polishing marks must be only in a radial direction, from root to tip.

OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION No. 72-515

Insert in 72-31-02 Repair 1 before page 403

REASON FOR ISSUE:

To discontinue on British Airways engines only, the post dressing procedures on L.P. compressor exit guide vanes as quoted in the Rolls-Royce repair procedure No.1. (MRA 71).

ACTION

Delete paragraphs B(5) Etch the vanes and B(7) Vapour blasting.

NOTE: Only applicable to British Airways engines.

OLYMPUS 593

MK.610-14-28

OVERHAUL

snecma

SEE TR

(k) Blend and polish to a surface finish of 32 MICROINCHES (0,8 MICROMETRES).

(3) Clean vanes by the process specified for the blades in 72-31-02 Cleaning.

(4) Vapour degrease the vanes (Ref.72-09-00 - Cleaning).

CAUTION: OBSERVE THE RESTRICTION ON THE PERIOD OF IMMERSION FOR TITANIUM COMPONENTS (REF.72-09-00, CLEANING).

(5) Etch the vanes (Ref.72-09-14 Repair).

(a) Use solution A.

(b) Mask the vane roots and other areas not to be etched, with I.C.I. Stopping-off Red Lacquer F230-2006.

(c) Etch the vanes for the minimum time required to achieve the desired surface for inspection, up to a maximum period of 20 seconds after the onset of gassing.

(d) Remove the masking lacquer by vapour degreasing to the approved specification (Ref.72-09-00 Cleaning).

(6) Repeat the test for cracks.

(7) Vapour blast blended vanes (Ref.72-09-00 - Cleaning).

(a) Apply masking tape to the vane roots and other areas which are not to be blasted.

(b) Vapour blast vanes to the Parameters for Procedure A and Special Details for Blades and Vanes specified in the vapour blasting procedure.

(c) Remove masking tape from the vanes.

OLYMPUS 593

MK.610-14-28

OVERHAUL

5. Assessment of Amount of Blending for Vane

- A. Vanes may be blended in several positions provided that the total extent of blending is not more than the equivalent of two blends to the maximum in zone 2.
- B. Depth of blending is controlled by zones.
- C. The maximum permissible number of blended vanes, when blended to maximum limits, is identified as L on Fig.402.
- D. Where vanes are not blended to the permissible maximum, this number (Ref.para.(C)) may be increased, provided that the aggregate of the blending does not exceed L.
- E. Permissible blending is controlled by depths, e.g.:
 - (1) 0.020 in. (0,51 mm) depth x two blends =
0.040 in. (0,102 mm) total = maximum blended vane.
 - (2) This maximum may be obtained as defined in (a), (b) or (c), or by any combination of depths the total of which does not exceed 0.040 in. (0,102 mm).
 - (a) 0.015 in. (0,38 mm) depth x two blends plus one
0.010 in. (0,254 mm) depth blend.
 - (b) 0.010 in. (0,254 mm) depth x two blends plus one
0.020 in. (0,51 mm) depth blend.
 - (c) 0.010 in. (0,254 mm) depth x four blends.
- B. One coupled blend = two blends.

6. Assessment of Blending Equivalent to L Number of Blended Vanes

A. Example:

- (1) L = five vanes x 0.040 in. (0,102 mm) depth =
0.200 in. (0,510 mm) aggregate depth.

DEFECTS IN ZONE X ADJACENT TO VANE PLATFORM MUST BLEND SMOOTHLY INTO FILLET RADIUS.

Figure 401

THIS SCHEME MUST BE READ IN CONJUNCTION WITH SAL B.930280 (REF.PARA.3.A).

L - MAXIMUM NUMBER OF VANES BLENDED TO MAXIMUM = 5.

AT LEAST 0.100 (2,54) MUST EXIST BETWEEN ADJACENT DENTS.

LIGHT EDGE NICKING IN ZONE X TO BE BLENDED, PROVIDED THE DEPTH OF BLEND DOES NOT EXCEED 0.010 (0,25) MAX.

BLEND RADII TO BE AS FOR ZONE Z.

LP Compressor Exit Guide Vanes - Blending Data
Figure 402

OLYMPUS 593

MK.610-14-28

OVERHAUL

(2) This aggregate may be obtained as defined in (a), (b) or (c), or by any aggregate of blended vanes which does not exceed 0.2000in. (0,510 mm).

(a) 0.033 in. (0,838 mm) depth x six vanes.

(b) 0.025 in. (0,635 mm) depth x eight vanes.

(c) 0.020 in. (0,508 mm) depth x ten vanes.

7. Identify Repair

A. Mark the repair scheme number SAL B.930279 close to the standard part number on the exit guide vanes (Ref. 72-09-00, Repair).

NOTE : Do not mark the number of this scheme SAL B.930280 on the vanes.

8. Special Tools, Fixtures and Equipment

A. Not required.

9. Replacement Parts

EXIT GUIDE VANE CASE - REPAIR
RESTORATION OF DOVETAIL SLOT BY WELDING

MODIFICATION NO. OL.8744C

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-31-02	1 150A	B.916419

2. Introduction

A. General.

- (1) This repair describes the procedure to restore the exit guide vane case dovetail slot to a serviceable condition by welding.
- (2) Dimensions are shown thus, INCHES (MILLIMETERS) in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (4) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,81 mm) unless otherwise stated.
- (5) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (6) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (7) Surface texture is to be 63 microinches (1,6 micrometers) unless otherwise stated.
- (8) All tools referred to by item number in procedural steps are detailed in para.4.
- (9) Protect the component against corrosion after each operation and place in a container for protection against damage during transit between operations.

B. Repair Limitations.

- (1) Welding must be confined to two exit guide vane positions.

3. Instructions

A. Weld.

- (1) Assemble the two halves of the exit guide vane case together using slave bolts.
- (2) Build up the defective area(s) (Ref.Fig.401) by inert gas arc welding, using filler rod MSRR 9500/10. The area must be built up sufficient to allow for final machining. The component material specification is MSRR 6503.
- (3) Check to ensure satisfactory welding.
- (4) Crack test the casing using the magnetic particle detection method detailed for this component in Chapter 72-31-02, Inspection/Check.

B. Heat Treat.

- (1) Install the casing to a furnace and heat treat to 650°C plus/minus 5°C for 1 hour. Cool in air.

C. Inspect.

- (1) Install the case in restraining ring ref. tool item 1 (Ref.Fig.402).
- (2) Measuring the datum A bore (Ref.Fig.403) check the casing for ovality. A maximum of 0.012 (0,30 mm) ovality is acceptable.
- (3) Crack test the casing using the magnetic particle detection method detailed for this component in Chapter 72-31-02, Inspection/Check.

LP COMPRESSOR ROTOR - REPAIR
ROTOR SHAFT REAR - LABYRINTH
FINS REPAIRED BY ROLL FORMING

Applicable to:

Rotor Shaft B.922515

Authority:

Modification No.OL.8324C

PRINTED IN ENGLAND

1. Introduction

- A. This Repair describes the procedure for restoring defective labyrinth fins on the LP compressor rotor shaft rear, in order to maintain the standard fin/housing clearances of labyrinth No.3, No.4 and No.5. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, the application of high heat resisting stoving enamel, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus in Tables and on illustrations: INCHES (MILLIMETRES).
- D. Protect the component against corrosion after each operation, and place in a container for protection against damage during transit between operations (Ref.72-09-20 Repair).

2. Repair Limitations

- A. Provided that specified dimensions can be maintained, fins may be repaired as follows:

Labyrinth No.3	Twice only
Labyrinth No.4 and No.5	Once only
- B. Fins which have previously been repaired by welding must not be restored by roll forming.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.3.B).

3. Summary of Operations

- A. Secure the shaft to the centre-lathe face-plate and set true on datum diameter A (Ref.Fig.401).

OVERHAUL

- B. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimensions (Ref. Table 401 and Fig.402). A localised "witness", not exceeding 0.003 in. (0,076 mm) is acceptable on each fin.
- C. Carefully remove any burrs.
- D. Apply the roll forming technique to increase the diameter of defective fins to the roll forming dimensions (Ref.Table 402 and Fig.403).
- E. Remove any folds by careful blending (Ref.Fig.404).
- F. Crack test the shaft by the process specified for this component in 72-31-03, Inspection/Check.
- G. Finish machine the fins (Ref.Fig.401); a maximum of 1.000 in. (25,4 mm) of the circumference which has not cleaned up is acceptable on each fin.
- H. Polish the fins to remove sharp edges.
- J. Repeat the test for cracks (para.F).
- K. Mask all threads and vapour blast the areas identified AH (Ref.Fig.405); use aluminium oxide grit mesh 280/500. Repair masking.
- L. Apply high heat resisting stoving enamel to the vapour blasted areas identified AH (Ref.Fig.405).
- M. Identify repair (Ref.Table 401). Mark the appropriate repair scheme number close to the standard part number on the rotor shaft.

LP COMPRESSOR ROTOR - REPAIR
ROTOR SHAFT FRONT - LABYRINTH
FINS REPAIRED BY ROLL FORMING

MODIFICATION NO. OL.8329CEffectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-31-03	1 90A	B.916195
	90B	B.922809

	90D	B.930060
		B.930062
		B.930063

1. Introduction

- A. This Repair describes the procedure for restoring defective labyrinth fins on the LP compressor rotor shaft front, in order to maintain the standard fin/housing clearances of labyrinth No.1 and No.2. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus in Tables and on illustrations:
INCHES (MILLIMETRES).

2. Repair Limitations

- A. This Repair may be applied once only.
- B. Fins which have previously been repaired by welding must not be restored by roll forming.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.3.B).

3. Summary of Operations

- A. Secure the shaft to the centre-lathe faceplate and set true on datum diameter A (Ref.Fig.401).

- B. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimensions (Ref. Table 401 and Fig.402). A localised "witness", not exceeding 0.003 in. (0,076 mm) in depth, is acceptable on each fin.
- C. Carefully remove any burrs.
- D. Apply the roll forming technique to increase the diameter of defective fins to the specified dimensions (Ref. Fig.403).
- E. Remove any folds by careful blending (Ref.Fig.404).
- F. Crack test the rotor shaft with fluorescent-penetrant.
- G. Finish machine the fins (Ref. Table 401 and Fig.401); a maximum of 1.000 in. (25,4 mm) of the circumference which has not cleaned up is acceptable on each fin.
- H. Polish fins to remove sharp edges.
- J. Chemically etch the rotor shaft using solution A, and etching technique, (Ref.72-09-14 Repair) and repeat the test for cracks (para.F).
- K. Vapour blast the rotor shaft; use grit mesh 280/500.
- L. Identify repair (Ref.Table 401). Mark the appropriate repair scheme number close to the standard part number on the rotor shaft.

		B.930062
		B.930063

1. Introduction

- A. This Repair describes the procedure for restoring a defective roller bearing location on the LP compressor rotor shaft front. The location is first machined undersize then built up by plasma spraying then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the spraying process applicable to this repair procedure.
- C. Dimensions are shown thus on illustrations:
INCHES (MILLIMETRES).

2. Repair Limitations

- A. Successive repairs may be applied at the bearing location, within the limits specified (Ref. para. 3.B.).

3. Summary of Operations

- A. Set the rotor shaft true on datum diameter A and face B (Ref. Fig. 401).
- B. Machine the defective location to the dimensions before spraying; in order to permit successive repairs, remove only the minimum amount of material necessary within the limits specified (Ref. Fig. 402).
- C. Test the rotor shaft for cracks with fluorescent-penetrant.

	2 30A	B.429874
	30B	B.922802
	30C	B.929445

1. Introduction

- A. This Repair describes the procedure for restoring defective labyrinth fins on the LP compressor rotor stage 1-2, 2-3 and 3-4 spacer rings, in order to maintain the standard fin/housing clearances. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus in tables and on illustrations: INCHES (MILLIMETRES).

2. Repair Limitations

- A. Fins which have previously been repaired by welding must not be restored by roll forming.
- B. The first repair to each spacer ring must be carried out in accordance with paragraph 3. Subsequent repairs must be carried out in accordance with paragraphs 3 and 4.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.3 and 4).

OLYMPUS 593

MK.610-14-28

OVERHAUL

3. Summary of Operations

- A. Locate the ring in fixture (Item 5) and set true in centre-lathe on datum face A (Ref.Fig.401).
- B. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimensions (Ref. Fig.402). A localised "witness", not exceeding 0.003 in. (0,076 mm) in depth, is acceptable on each fin.
- C. Carefully remove any burrs.
- D. Apply the roll forming technique to increase the diameter of defective fins to the specified dimensions (Ref. Fig.403).
- E. Remove any folds by careful blending (Ref.Fig.403).
- F. Crack test the spacer ring by the process specified for this component in 72-31-03, Inspection/Check.
- G. Finish machine the fins (Ref.Fig.401); a maximum of 1.000 in. (25,4 mm) of the circumference which has not cleaned up is acceptable on each fin.
- H. Polish fins to remove sharp edges.
- J. Chemically etch the spacer ring using solution A, and etching technique, (Ref.72-09-14 Repair) and repeat the test for cracks (para.F).
- K. Vapour blast the spacer ring; use alumina, garnet or quartz grit mesh 320/400.
- L. Identify repair (Ref.Fig.401). Mark the appropriate repair scheme number close to the standard part number on the spacer ring. For the second repair, mark /2 against the existing repair scheme number.

4. Amended dimensions for repeated rolling of stages 1-2, 2-3 and 3-4 labyrinth fins

- A. Machining dimensions before roll forming (Ref.Fig.402) may be reduced by 0.015 in. (0,38 mm) maximum, if necessary.

4. Instructions

A. General.

- (1) Test blades for cracks, before and after blending, by the fluorescent dye process specified for the blades in 72-31-03 Inspection/Check; reject cracked blades.
- (2) Blades with dents which deform the opposite surface of the blade are not acceptable for blending; reject blades with this form of damage
- (3) A blend in one zone can run out into the adjacent zone even if it infringes the blend limit for that zone, except at zone X.

B. Procedure.

- (1) Crack test blades to determine full extent of damage. Refer to the fluorescent dye process specified for the blades in 72-31-03 Inspection/Check.

- (2) Dress to remove damage.

CAUTION: IF MECHANICAL BLENDING METHODS ARE USED,
ENSURE THAT BLADES ARE NOT OVERHEATED.

- (a) Polish acceptable surface dents (Ref. para.4.(2)) to remove burrs.
- (b) Blend torn, rough or scored edges to a depth 20 per cent greater than the depth of damage, provided that specified limits are not exceeded.
- (c) If adjacent blends interfere, remove material from between them to produce a coupled blend.
- (d) Profile edge blends smoothly into the aerofoil shape (Ref.Fig.401).
- (e) Polish blends and defective areas.
- (f) Remove only the minimum amount of material consistent with specified requirements and dimensions.

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION No. 72-513

Insert in 72-31-03 Repair 6 before page 403

REASON FOR ISSUE:

To discontinue on British Airways engines only, the post dressing procedure on L.P. compressor blades as quoted in the Rolls-Royce repair procedure No.6. (MRA 69).

ACTION

Delete paragraphs B(5) Etch the blades and B(7) Vapour blasting.

NOTE: Only applicable to British Airways engines.

OLYMPUS 593

MK.610-14-28

SNECMA

OVERHAUL

- (g) In zone X, blending is permitted only as defined in (i) and (ii).
 - (i) Blend light nicking of the edges.
 - (ii) Polish out light surface scratches; 0.002 in. (0,050 mm) maximum permissible depth.
- (h) For opposing blends the chordal width must not be reduced by more than A, B or C, as applicable.
- (j) When blending within dimension D of blade tip, blend out towards the tip.
- (k) Blending and polishing marks must be only in a radial direction, from root to tip.
- (l) Blend and polish to a surface finish of 32 MICROINCHES (0,8 MICROMETRES).
- (3) Clean blades by the process specified for the blades in 72-31-03 Cleaning.
- (4) Vapour degrease the blades (Ref.72-09-00 - Cleaning).
- CAUTION: OBSERVE THE RESTRICTION ON THE PERIOD OF IMMERSION FOR TITANIUM COMPONENTS (REF. 72-09-00 CLEANING).
- (5) Etch the blades (Ref.72-09-14 Repair).
 - (a) Use Solution A either by Immersion or by Swab etch.
 - (b) For Immersion etching proceed as follows:
 - (i) Mask the blade roots and other areas not to be etched, with approved Acid Resistant Lacquer (I.C.I.F230-2006).
 - (ii) Etch the blades for the minimum time to achieve the desired surface for inspection, up to a maximum time of 20 seconds after the onset of gassing.
 - (iii) Remove the Lacquer by vapour degreasing (Ref.72-09-00 Cleaning).

OVERHAUL

- (c) For Swab etching, apply the etch to the repaired area only. Do not allow the etch solution to come into contact with blade roots. Swab etch for a minimum time of 30 seconds.
- (6) Repeat the test for cracks.
- (7) Vapour blast blended blades (Ref.72-09-13 Repair).
 - (a) Apply masking tape to the blade roots and other areas which are not to be blasted.
 - (b) Vapour blast blades to the Parameters for Procedure A and Special Details for Blades and Vanes specified in the vapour blasting procedure.
 - (c) Remove masking tape from the blades.
- 5. Assessment of Amount of Blending per Blade (All Stages)
 - A. Blades may be blended in several positions provided that the total extent of blending is not more than the equivalent of two blends to the maximum in zone Z.
 - B. Depth of blending is controlled by zones.
 - C. The maximum permissible number of blended blades per stage, when blended to maximum limits, is identified as L on the illustrations.
 - D. Where blades are not blended to the permissible maximum, this number (Ref.para.C.) may be increased, provided that the aggregate of the blending does not exceed L.

- E. Permissible blending is controlled by depths e.g. stage 1 blade.
- (1) 0.600 in. (15,24 mm) depth x two blends = 1.200 in. (30,48 mm) total = maximum blended blade.
- (2) This maximum may be obtained as defined in (a), (b) or (c), or by any combination of depths the total of which does not exceed 1.200 in. (30,48 mm).
- (a) 0.300 in. (7,62 mm) depth x four blends.
- (b) 0.150 in. (3,81 mm) depth x eight blends.
- (c) 0.100 in. (2,54 mm) depth x twelve blends.
- F. One coupled blend = two blends.
- G. Dimension D blend = one blend.
- H. Dimension E blend = half blend (depth assessed as RADIUS divided by 2).

6. Assessment of Blending Equivalent to L Number of Blended Blades Per Stage

A. Example for stage 1 blade.

- (1) L = three blades x 1.200 in. (30,48 mm) depth = 3.600 in. (91,44 mm) aggregate depth.
- (2) This aggregate may be obtained as defined in (a); (b) or (c), or by any aggregate of blended blades which does not exceed 3.600 in. (91,44 mm).
 - (a) 0.900 in. (22,86 mm) depth x four blades.
 - (b) 0.600 in. (15,24 mm) depth x six blades.
 - (c) 0.300 in. (7,62 mm) depth x twelve blades.

7. Identify Repair (Ref. Table 401)

- A. Mark the repair scheme number, appropriate to the stage of blades, close to the standard part number on the blades (Ref.72-09-00 Repair).

NOTE: Do not mark the number of this scheme
SAL B.930265 on the blades.

2. Introduction

A. General.

CAUTION: THIS PROCEDURE CONTAINS OPERATIONS THAT ARE SUBJECT TO COMPONENT MANUFACTURING TECHNIQUE (CMT) CONTROL. THESE OPERATIONS SHALL NOT BE VARIED WITHOUT REFERENCE TO THE MANUFACTURER.

- (1) This repair describes the procedure for removing light impact and other damage from the broached root forms of disks (Ref.Fig.401), by blending using conventional hand tools (Ref. 72-09-22 Repair).
- (2) Dimensions are shown thus in tables and illustrations: INCHES (MILLIMETERS).
- (3) Refer to Chapter 72-09-00 Repair, for all standard practices applicable to this repair procedure.
- (4) Remove all sharp edges 0.004 to 0.020 in. (0,102 to 0,508 mm) unless otherwise stated.
- (5) Tolerances on dimensions are plus/minus 0.010 in. (0,25 mm), unless otherwise stated.

St.5	CMT 109/B.497538
St.6	CMT 110/B.497538
St.7	CMT 111/B.497538

- (7) Operations detailed in this repair procedure that are subject to Component Manufacturing Technique Control are identified by the initials 'CMT'.

B. Repair Limitations.

- (1) Damage to loaded flanks (Ref.Fig.402) is not acceptable.
- (2) Blend depth maximums are as follows:

<u>Area (Ref.Fig.402)</u>	<u>Maximum Blend Depth</u> (<u>Ref.Fig.403</u>)
A	0.005 in. (0,127 mm).
B and C For C, W max = 0.010 in. (0,25 mm)	'W x L' must not exceed 10% of the surface area of loaded flank face.
D and E (Critical Areas)	0.002 in. (0,05 mm).
F	Depth S not to exceed 10% of T.

- (3) No blend to extend below XX (Ref.Fig.403).

3. Instructions

A. Blend and Polish.

MK.610-14-28 SNECMA
OVERHAUL

- (1) Hand blend the damaged areas, within limitations, to remove damage, using conventional hand tools and produce radii as required at intersection of blend and flank (Ref.Fig.402 and 403). When blending area B the edge between the disk face and the serration must be radiused. The aim is to produce a radiused form, but a chamfer blended at the corners is acceptable, provided it falls within the dimensions shown in Fig.404 (Ref.72-09-22 Repair).
- (2) Polish areas blended to achieve a surface finish of 63 micro inches (1,6 micrometers). Area D (Ref.Fig.402) must only be hand polished using fine grade emery cloth.

B. Inspect.

- (1) Etch the blended areas in accordance with Chapter 72-09-14, Repair, using solution A. CMT
- (2) Test the blended areas for cracks using the fluorescent dye penetrant process specified for this component in Chapter 72-31-03, Inspection/Check. CMT

C. Vapour Blast.

- (1) Vapour blast the etched areas in accordance with Chapter 72-09-13, Repair, using procedure B. CMT

D. Identify.

- (1) Using the vibro-percussion engraving technique, Ref. Chapter 72-09-00, Repair, mark on SAL B.497538 or R7 adjacent the existing part number. Markings must be clear of the blade slots by 0.030 in. (0,75 mm) minimum.

E. Finally Inspect.

- (1) Finally inspect the disk to ensure the repair has been carried out satisfactorily and that the disk is in a serviceable condition.

4. Special Tools, Fixtures and Equipment

None required.

5. Replacement Parts

None required.

2. Introduction

A. General.

CAUTION: THIS PROCEDURE CONTAINS OPERATIONS THAT ARE SUBJECT TO COMPONENT MANUFACTURING TECHNIQUE (CMT) CONTROL. THESE OPERATIONS SHALL NOT BE VARIED WITHOUT REFERENCE TO THE MANUFACTURER.

- (1) This repair describes the procedure to be followed in order to restore to a serviceable condition LP compressor rotor spacer rings (stages 1/2, 2/3, 3/4, 4/5, 5/6 and 6/7) that have been rendered unserviceable through wear of the outer diameter of the labyrinth fins.

REPAIR

72-31-03

Repair No.8

Page 401

Aug 1/81

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) The defective spacer ring is restored to an acceptable condition by machining the labyrinth fins to a uniform diameter, increasing this diameter by the deposition of metal using the plasma welding technique, and finally machining the fins to the required dimensions.
- (3) Refer to Chapter 72-09-00 Repair, for all Standard Practices applicable to this repair procedure.
- (4) Dimensions in tables and on illustrations are shown thus: INCHES (MILLIMETRES).
- (5) Remove all sharp edges 0.004 to 0.020 in. (0,102 to 0,508 mm), unless otherwise stated.
- (6) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (7) Tolerances on angles are plus/minus 2 degrees unless otherwise stated.
- (8) Operations detailed in this repair procedure that are subject to Component Manufacturing Technique Control are identified by the initials 'CMT'.
- (9) This repair procedure covers stages 1/2 to 6/7 spacer rings in the LP compressor rotor; each stage has its own salvage number, repair scheme number suffix and CMT control certificate number as follows:

Spacer Ring Stage	Salvage Number	Repair Scheme Number	CMT Certificate Number
1/2	B.497449	R.7A	CMT 112/B.497449
2/3	B.497450	R.7B	CMT 113/B.497450
3/4	B.497451	R.7C	CMT 114/B.497451
4/5	B.497452	R.7D	CMT 115/B.497452
5/6	B.497453	R.7E	CMT 116/B.497453
6/7	B.497454	R.7F	CMT 117/B.497454

- (10) The steps of procedure detailed in paragraph 4 are applicable to all stages of spacer rings covered by this repair unless a statement is made to the contrary.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (11) All tools referred to by item number in procedural steps are detailed in paragraph 5.
- (12) A test piece must be produced, subjected to the various processes detailed in this repair procedure and metallurgically examined, prior to commencement of each of the salvage schemes. A new test piece is required initially and upon any change of airline operator, sub-contractor, machine or welding equipment (Ref.para.3).

3. Production and Use of Test Piece

A. Produce Test Piece.

- (1) Withdraw from stores non-standard spacer ring, part number B.356374. This component is in a fully heat-treated condition.
- (2) Etch the spacer ring (Ref.72-09-14 Repair); use solution 'A' detailed in the referenced procedure. Component to be immersed in the solution for a period of 30 seconds from the onset of gassing.
- (3) Test the spacer ring for cracks; use the fluorescent dye penetrant process specified for this component in 72-31-03 Inspection/Check.
- (4) Line through all existing markings on the spacer ring and mark on 'B.497465 TEST PIECE'; use the electro-chemical marking technique (Ref.72-09-00 Repair). This component may be used as a test piece for all the salvage schemes covered by this repair procedure.

B. Machine Test Piece.

- (1) Install the test piece in machining fixture (Ref. para.4 Item 3 and Fig.405). Secure in position using four clamps.
- (2) Install machining fixture/test piece on a centre lathe; set true on fixture clocking diameter (Ref.Fig.405).

REPAIR

72-31-03

Repair No.8

Page 403

Mar 1/81

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (3) Machine the outer diameter of the labyrinth fins to produce 16.265/16.260 in. (413,13/413,00 mm) dimension (Ref.Fig.401).
- (4) Remove machining fixture/test piece from the lathe and remove the test piece from the fixture.
- (5) Remove all burrs from the machined area of the test piece; use conventional hand tools.

C. Build Up Labyrinth Fins on Test Piece.

- (1) Build up the labyrinth fins to produce a minimum diameter of 16.470/16.460 in. (418,338/418,084 mm) (Ref.Fig.401); use the plasma welding technique detailed in Chapter 72-09-12 Repair, and observe the following instructions.
 - (a) Allow component to cool for 10 to 15 minutes between each weld deposit.
 - (b) Clean each weld deposit; use a rotary stainless steel brush.
 - (c) Remove surface cavities and weld bead irregularities on completion of each weld deposit; use a non-abrasive cutter.
- (2) Welding data.

OVERHAUL

Feed rate (wire):	40 in. (1016 mm) per minute
Machine:	Union Carbide 100 amp with fine wire feed
Upslope current:	Nil
Welding current:	1st run - 35 amps no wire
(Applicable to all fins)	2nd/3rd runs - 35 amps with wire
	4th/5th runs - 26 amps with wire
	6th run - 24 amps with wire
	7th/subsequent runs - 22 amps with wire
Downslope current:	Machine maximum
Plasma gas (torch):	Argon 0.35 cu ft/h at 30 psi (0,165 l/min at 207 kPa)
Shield gas (torch):	Argon 15 cu ft/h at 30 psi (7 l/min at 207 kPa)
Backing gas:	Nil
Trailing gas:	Argon 30 cu ft/h at 30 psi (14 l/min at 207 kPa)
Weld speed:	5 in./min (127 mm/min) on Roturn variable control turntable
Nozzle:	orifice dia. 0.052 in. (1,321 mm)
Electrode:	3/32 in. (2,3812 mm) dia. thoriated tungsten
Arc length:	0.200 in. (5,08 mm)
Polarity:	Electrode negative

C. Examine Test Piece.

- (1) Test the spacer ring (test piece) for cracks; use the fluorescent dye penetrant process specified for this component in 72-31-03 Inspection/Check.
- (2) Metallurgically examine the test piece.

NOTE: The following examination must be carried out by the controlling laboratory.

- (a) Produce four suitable micro-sections at 90 deg from the test piece weld surface (Ref.Fig.401).

TN31736

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (b) Subject the micro-sections to a VPN hardness check using a 5 kg load and a 2/3rd objective at 0.020 in. (0,508 mm) increments traversed across the micro-sections. Check that the heat affected zone is limited to the specified area (Ref. Fig.401).

4. Repair LP Compressor Rotor Spacer Rings

A. Machine Spacer Ring.

- (1) Install spacer ring in a machining fixture suitable for the stage of spacer ring under repair (Ref. para.4 Item 1, 2 or 3 and Fig.402, 403, 404 or 405). Secure in position using four clamps.
- (2) Install machining fixture/spacer ring on a centre lathe; set true on fixture clocking diameter.
- (3) Machine the outer diameter of spacer ring labyrinth fins to produce required diameter (Ref. diameter 'X' Table 401 and Fig.406).
- (4) Remove machining fixture/spacer ring from the lathe and remove the spacer ring from the fixture.
- (5) Remove all burrs from the machined area of the spacer ring; use conventional hand tools.
- (6) Inspect the spacer ring to ensure satisfactory completion of the specified machining operation.

B. Examine Spacer Ring.

- (1) Test the spacer ring for cracks; use the fluorescent dye penetrant process specified for this component in 72-31-03 Inspection/Check. CMT

C. Build Up Labyrinth Fins on Spacer Ring.

- (1) Build up the labyrinth fins to produce a minimum weld build up of 0.080 in. (2,032 mm) (Ref.Fig.406); use the plasma welding technique detailed in Chapter 72-09-12 Repair, and observe the following instructions: CMT
 - (a) Allow component to cool for 10 to 15 minutes between each deposition of weld material.

OLYMPUS 593

MK.610-14-28

OVERHAUL

Welding current:

Stage 1/2 spacer ring: No.1 fin - 1st run; 23 amps
no wire
Subsequent runs;
27 amps with wire

No.2-5 fins - 1st run; 29
amps no wire
Subsequent
runs; 32 amps
with wire

Stage 2/3 spacer ring: All fins - 1st run; 32 amps
no wire
Subsequent runs;
34/38 amps with
wire

Stage 3/4, 4/5, 5/6
and 6/7:

All fins - 1st run; 32 amps
no wire
Subsequent runs;
34 amps with wire

D. Examine Spacer Ring.

- (1) Test the spacer ring for cracks; use the fluorescent dye penetrant process specified for this component in 72-31-03 Inspection/Check. CMT

E. Machine Spacer Ring.

- (1) Install spacer ring in a machining fixture suitable for the stage of spacer ring under repair (Ref. para.4 Item 1, 2 or 3 and Fig.402, 403, 404 or 405). Secure in position using four clamps.
- (2) Install machining fixture/spacer ring on a centre lathe; set true on fixture clocking diameter.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Finish turn the built-up fins on the spacer ring to produce the required dimensions (Ref.Fig.406 and Table 401); use the specified form tool (Ref.para.4 Item 4). Observe the following parameters: CMT

Coolant:	Neat soluble oil at 60-1 dilution
Speed:	50-100 rpm and 15 rpm (manual)
Feed:	0.004 in. (0,10 mm) per revolution
Depth of finishing cut:	0.002 in. (0,05 mm) maximum

- (4) Remove machining fixture/spacer ring from the lathe and remove the spacer ring from the fixture.
- (5) Remove all burrs and sharp edges from the machined area of the spacer ring; use conventional hand tools.

REPAIR

72-31-03

Repair No.8

Page 414

Jun 1/82

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) Inspect the spacer ring to ensure satisfactory completion of the specified machining operations.

F. Etch the Spacer Ring.

- (1) Etch the spacer ring (Ref.72-09-14 Repair); use immersion solution 'A' detailed in the referenced procedure. Component to be immersed in the solution for a period of 30 seconds from the onset of gassing. CMT

G. Examine the Spacer Ring.

- (1) Test the spacer ring for cracks; use the fluorescent dye penetrant process specified for this component in 72-31-03 Inspection/Check. CMT

H. Vapour Blast the Spacer Ring.

- (1) Vapour blast the spacer ring (Ref.72-09-13 Repair); use Procedure 'B' detailed in referenced procedure. CMT

J. Identify Repair.

- (1) Mark the repair scheme number (Ref.para.2.A.(9)) close to the standard part number on the repaired spacer ring; use the electro-chemical marking technique (Ref.72-09-00 Repair).

K. Inspect the Spacer Ring.

- (1) Carry out a final visual inspection and dimensional check of the spacer ring to ensure satisfactory completion of repair and suitability for service.

2. Introduction

A. General.

CAUTION: THIS PROCEDURE CONTAINS OPERATIONS THAT ARE SUBJECT TO COMPONENT MANUFACTURING TECHNIQUE (CMT) CONTROL. THESE OPERATIONS SHALL NOT BE VARIED WITHOUT REFERENCE TO THE MANUFACTURER. CMT CERTIFICATE NUMBER CMT 122/B.935531.

- (1) This repair describes the procedure for restoring a corroded thrust bearing location on the rear rotor shaft by plasma spraying and machining to standard dimensions.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES) in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (4) The operations that are subject to Component Manufacturing Technique Control are indicated CMT.
- (5) A test piece shall be produced and subjected to metallurgical examination; test pieces are required initially, and upon any change of airline operator, sub-contractor, machine or welding equipment.
- (6) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (7) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.

- (8) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (9) Surface texture is to be 125 micro inches (3,2 micro-metres) unless otherwise stated.
- (10) All tools referred to by item number in procedural steps are detailed in para.4.
- (11) Protect the component against corrosion after each operation and place in a container for protection against damage during transit between operations (Ref.72-09-20 Repair).

B. Repair Limitations.

None.

3. Instructions

A. Remove aluminium paint.

- (1) Remove the aluminium paint, if not already removed, using cleaning process F (Ref.72-09-00 Cleaning).

B. Machine.

- (1) Locate the flange of the rear rotor shaft to the faceplate of a grinding machine and set true.
- (2) Grind the thrust bearing location to 5.463 in. (138,76 mm) minimum diameter, under the following conditions:

Grinding wheel	:	A60 KV grit range 46-80 grade range J-L.
Coolant	:	Translucent soluble oil
Feed	:	0.0005 in. (0,013 mm)/rev.
Surface speed	:	70-92 ft/min (21,3 - 28,0 m/min)

CMT

- (3) Remove burrs and sharp edges.

C. Inspect.

- (1) Inspect for the satisfactory completion of the grinding operation.

- (2) Inspect for cracks using the magnetic particle crack detection procedure for this component in Chapter 72-31-03, Inspection/Check.

CMT

D. Plasma Spray.

- (1) Plasma flame spray the area indicated in Fig.401 and 402 using the technique specified in Chapter 72-09-11, Repair, with METC0450 (MSRR 9507/5).

CMT

E. Inspect.

- (1) Inspect for the satisfactory completion of the spraying operation.

F. Machine.

- (1) Locate the flange of the rear rotor shaft to the faceplate of a grinding machine and set true.
- (2) Finish grind the thrust bearing location to 5.5007/5.5002 in. (139,718/139,705 mm) diameter, under the following conditions:

Grinding wheel	:	A60 JV grit range 46-80 grade range I-K
Coolant	:	Soluble oil 60 to 1 dilution
Feed	:	0.0002 in. (0,0051 mm) per rev.
Surface speed	:	85-100 ft/min (25,9 - 30,5 m/min)

CMT

- (3) Remove burrs and sharp edges.

G. Inspect.

- (1) Inspect for the satisfactory completion of the grinding operation.
- (2) Inspect for cracks using the fluorescent dye penetrant process detailed for this component in Chapter 72-33-02, Inspection/Check.

CMT

H. Aluminium Paint.

- (1) Apply high heat resisting aluminium enamel to the areas indicated AH in Fig.403, using the process detailed in Chapter 72-09-04, Repair.

J. Inspect.

- (1) Inspect for the satisfactory completion of the painting operation.

K. Identify.

- (1) Mark SAL.B.935531 or R9 adjacent to the existing part number, using the electro-chemical marking or vibro-percussion engraving (Ref.72-09-00, Repair).
- (2) When B.922515 and B.930085 are protected with heat resisting aluminium enamel on the flanges (Ref. Fig.403), the part numbers change (Ref.SB.0L.593-72-8763-293). Line through the existing part numbers, and mark on new part numbers as follows:

B.922515 becomes B.935731
B.930085 becomes B.936864

Use electro-chemical marking or vibro-percussion engraving (Ref.72-09-00, Repair).

L. Final Inspection.

- (1) Finally inspect the rear rotor shaft to ensure that the repair has been carried out satisfactorily, and that the shaft is in a serviceable condition.

4. Special Tools, Fixtures and Equipment

None.

5. Replacement Parts

None.

B. Repair Limitations.

- (1) On disk stages 3, 4, 5 and 6, blends are not permitted directly opposite each other through the thickness of the web.
- (2) Blending must not be carried out over the area indicated in Fig.401.
- (3) Maximum blend depths are as follows:

<u>Area (Ref.Fig.401)</u>	<u>Max. Blend Depth</u>
AB	0.010 in. (0,25 mm)
AC	0.005 in. (0,13 mm)

3. Instructions

A. Blend and Polish.

- (1) Hand blend the damaged areas, in accordance with Overhaul Manual chapter 72-09-22, Repair within limitations, to remove damage using conventional hand tools.

OVERHAUL

(2) Where damage extends into bolt-hole chamfers or bore chamfer, radius the corners after blending as detailed in Fig.402.

(3) Polish the blended areas to achieve a surface finish of 63 micro-inches (1,6 micro-metres). Blends must be smooth, continuous and free from scratches.

B. Inspect.

(1) Etch the blended areas in accordance with Chapter 72-09-14 Repair, using solution A. CMT

(2) Inspect for cracks using the fluorescent dye penetrant process specified for this component in Chapter 72-31-03, Inspection/Check. CMT

C. Vapour Blast.

(1) Vapour blast the etched areas in accordance with Chapter 72-09-13 Repair, using procedure B. CMT

D. Identify.

(1) Mark SAL B.935533 or R10 next to the existing part number, but not closer than 0.030 in. (0,75 mm) to the blade slots. Use vibro-percussion engraving Ref. Chapter 72-09-00 Repair.

E. Final Inspection.

(1) Finally inspect the disks to ensure that the repair has been carried out satisfactorily and that the disks are in a serviceable condition.

4. Special Tools, Fixtures and Equipment

None.

LP COMPRESSOR ROTOR - REPAIR BY
BLENDING AND POLISHING DAMAGED
STAGE 1 BLADES WITH SHOT PEENED AEROFOIL

MODIFICATION NO.OL.8832C

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Stage</u>	<u>Part No.</u>
72-31-03	01/1500	1	B.935789 B.935790 B.935791 B.935792

2. Introduction

- A. The text and Fig. 401 of this Repair defines the blending procedure applicable to LP compressor stage 1. rotor blades stated above and must be read in conjunction with the specific data for this stage (Ref.Fig.402).
- B. Refer to 72-09-00 Repair for all standard practices applicable to this repair procedure.
- C. Dimensions are shown thus:
- INCHES (MILLIMETRES).
- D. Produce a test piece to ensure that the correct parameters are used, (Ref.72-09-15 Repair).

3. Instructions

A. General

- (1) Test blades for cracks, before and after blending, by the fluorescent dye process specified for the blades in 72-31-03 Inspection/Check; reject cracked blades.
- (2) Blades with dents which deform the opposite surface of the blade are not acceptable for blending; reject blades with this form of damage.

REPAIR

72-31-03

Repair No.11

Page 401

Jun 1/83

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) A blend in one zone can run out into the adjacent zone even if it infringes the blend limit for that zone, except at zone X.

B. Procedure

- (1) Crack test blades to determine the full extent of the damage. Refer to the fluorescent dye process specified for the blades in 72-31-03 Inspection/Check.
- (2) Dress to remove damage.

CAUTION: IF MECHANICAL BLENDING METHODS ARE USED, ENSURE THAT THE BLADES ARE NOT OVERHEATED.

- (a) Polish acceptable surface dents; Ref. to para. 3(2).
- (b) Blend torn, rough or scored edges to a depth 20 per cent greater than the damage depth, provided that the specified limits are not exceeded.
- (c) If adjacent blends interfere, remove the material from between them to produce a coupled blend.
- (d) Edge blends to be smoothly profiled into aerofoil shape (Ref.Fig.401).
- (e) Polish blends and defective areas.
- (f) Remove only the minimum amount of material consistent with specified requirements and dimensions.
- (g) In zone X, blending is permitted only as defined in (i) and (ii).
- (i) Blend light nicking of the edges.
- (ii) Polish out light surface scratches, 0.002 in. (0,050 mm) maximum permissible depth.
- (h) For opposing blends the chordal width must not be reduced by more than A, B or C, as applicable.

MK.610-14-28

SNECMA

OVERHAUL

- (j) When blending within dimension D of blade tip, blend out towards the tip
- (k) Blending and polishing marks must only be in a radial direction, from root to tip.
- (l) Blend and polish to a surface finish of 32 MICROINCHES (0,8 MICROMETRES).
- (3) Clean the blades by the process specified for blades in 72-31-03 cleaning.
- (4) Vapour degrease the blades.

CAUTION: OBSERVE THE RESTRICTION ON THE PERIOD OF IMMERSION FOR TITANIUM COMPONENTS (REF. 72-09-00 CLEANING).

- (5) Etch the blades (Ref.72-09-14 Repair).
 - (a) Use Solution A either by Immersion or by Swab etch.
 - (b) For Immersion etching proceed as follows:
 - (i) Mask the blade roots and other areas not to be etched, with approved Acid Resistant Lacquer (I.C.I.F230-2006).
 - (ii) Etch the blades for the minimum time to achieve the desired surface for inspection, up to a maximum time of 20 seconds after the onset of gassing.
 - (iii) Remove the Lacquer by vapour degreasing (Ref.72-09-00 Cleaning).
 - (c) For Swab etching, apply the etch to the repaired area only. Do not allow the etch solution to come into contact with blade roots. Swab etch for a minimum time of 30 seconds.

- (6) Repeat the test for cracks.

NOTE: If mechanical polishing methods have been used, also inspect for burns.

- (7) Shot peen the blade aerofoil surface.

- (a) Process control.

Parameters for shot peening.

- | | |
|---------------------------|-----------------------|
| (i) Peening medium | S230 size steel shot. |
| (ii) Intensity | 6-10 'A' |
| (iii) Coverage | 200 per cent |
| (iv) Almen 'A' test strip | |

- (b) Safety precautions.

- (i) All apparatus must be earthed to ensure dispersion of any heavy charge which might be generated during the process.
- (ii) Cabinets must be fitted with explosion doors and continuous low speed air extraction.
- (iii) A face mask and rubber protective gloves must be worn by the operator during peening and when cleaning the exhaust filters.

REPAIR

MK.610-14-28

OVERHAUL

(c) Peening intensity.

- (i) Shot peen the test piece using the parameters detailed in para. (7)(a), ensuring a uniform coverage of the exposed surface.
- (ii) Remove the Almen test piece and measure the "height of arc" of curvature of the test piece with a standard Almen gauge; Ref. to 72-09-15 Repair.

NOTE: Full control is essential on all aspects of the peening process to ensure that the amount and uniformity of stress and depth of layer is consistently maintained. Use automatic peening wherever possible.

(d) Mask the areas that do not require shot peening.

(e) Shot peen the blade aerofoil surface. Refer to Figure 403 for the shot peening area.

NOTE: Overspray onto the blade platform is permissible.

(f) Inspect the blade aerofoil surface.

- (i) Visually inspect the shot peened surfaces for uniformity of coverage and complete overlapping of shot impressions.
- (ii) Inspect the peened surfaces at X5 magnification to ensure that no roughness is present.

OVERHAUL.

(iii) Repeat the shot peening process at once if the uniformity of coverage or intensity has not been achieved.

(8) Dry glass bead peen the aerofoil surface.

(a) Apply dry glass bead peening to the aerofoil surface and any overspray areas, observing the safety precautions referred to in para. (7) (b). Avoid direct contact with the powdered glass.

(b) Process control.

Parameters for dry glass bead peening.

(i)	Blasting medium	Glass beads 0.0015/0.003 in. (0,0381/0,762 mm) diameter
(ii)	Intensity	4-8 N
(iii)	Coverage	200 per cent
(iv)	Peening test strip	Type N

(c) Peening intensity.

(i) Vapour degrease the Almen 'N' test piece, refer to Overhaul Manual (72-09-00 Cleaning).

(ii) Establish the peening intensity, refer to para. (7)(c) for procedure.

(d) Mask the areas that do not require glass bead peening.

(e) Check that the glass beads are not contaminated and that the beads are free from sharp edges and broken pieces.

(f) Secure the blade in the blast cabinet; check that the cabinet is charged with the correct peening medium.

REPAIR

Repair No.11
Page 408
Mar 1/85

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (g) Dry glass beadpeen the aerofoil surface and any overspray areas to produce an even coloured uniform matt surface.
- (h) Remove all trace of dry glass bead peening medium from the blade surface using a clean, dry air blast or a soft brush, vacuum assisted if necessary, to remove the particles.

NOTE: Reduce handling of the blade to a minimum to avoid contamination.

- (j) Inspect the blade aerofoil surface.
 - (i) Visually inspect the glass bead peened surface for uniform coverage and complete overlapping of the shot impressions.
 - (ii) Inspect the glass bead peened surface using X5 magnification ensuring that no roughness is present.
 - (iii) Repeat the peening process immediately if the uniformity of coverage or intensity has not been achieved.
- (9) Mark 'SAL.B.935525' or 'R11' adjacent to normal part number. Use the vibro-percussion engraving technique or the electro-chemical marking technique. (Ref. 72-09-00 Repair).

- (10) Finally inspect the blade for completion of the previous operations.

4. Assessment of Amount of Blending per Blade

- A. Blades may be blended in several positions provided that the total extent of blending is not more than the equivalent of two blends to the maximum in zone Z.
- B. Depth of blending is controlled by zones.
- C. The maximum permissible number of blended blades in the stage, when blended to maximum limits, is identified as L in para. 6.

REPAIR

72-31-03

Repair No.11
Page 409
Jun 1/83

OLYMPUS 593

MK.610-14-28
OVERHAUL

D. Where blades are not blended to the permissible maximum, this number (Ref. Para. C.) may be increased, provided that the aggregate of the blending does not exceed L.

E. Permissible blending is controlled by depths.

Example:

- (1) 0.600 in. (15,24 mm) depth x two blends = 1.200 in. (30,48 mm) total = maximum blended blade.
- (2) This maximum may be obtained as defined in (a), (b) or (c), or by any combination of depths, the total of which does not exceed 1.200 in. (30,48 mm).
 - (a) 0.300 in. (7,62 mm) depth x four blends.
 - (b) 0.150 in. (3,81 mm) depth x eight blends.
 - (c) 0.100 in. (2,54 mm) depth x twelve blends.

F. One coupled blend = two blends.

G. Dimension D blend = one blend.

H. Dimension E blend = half blend (depth assessed as $RADIUS \div 2$).

5. Assessment of Blending Equivalent to L number of Blended Blades Per Stage

A. Example:

- (1) L = three blades x 1.200 in. (30,48 mm) depth = 3.600 in. (91,44 mm) aggregate depth.
- (2) This aggregate may be obtained as defined in (a), (b) or (c), or by any aggregate of blended blades which does not exceed 3.600 in. (91,44 mm).
 - (a) 0.900 in. (22,86 mm) depth x four blades.
 - (b) 0.600 in. (15,24 mm) depth x six blades.
 - (c) 0.300 in. (7,62 mm) depth x twelve blades.

2. Introduction

A. General

CAUTION: THIS PROCEDURE CONTAINS OPERATIONS THAT ARE SUBJECT TO COMPONENT MANUFACTURING TECHNIQUE (CMT) CONTROL. THESE OPERATIONS SHALL NOT BE VARIED WITHOUT REFERENCE TO THE MANUFACTURER.

CMT CERTIFICATE NUMBER CMT 122/B.935539.

- (1) This repair describes the procedure for removing corrosion pitting by machining and grit blasting, followed by application of protective coating.
- (2) Dimensions are shown thus, INCHES (MILLIMETERS) in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (4) The operations that are subject to Component Manufacturing Technique Control are indicated CMT.
- (5) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (6) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (7) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.

- (8) Surface texture is to be 125 micro inches (3,2 micrometres) unless otherwise stated.
- (9) Protect the component against corrosion after each operation and place in a container for protection against damage during transit between operations (Ref.72-09-20 Repair).

B. Repair Limitations

- (1) This repair may be carried out once only.

3. Instructions

A. Preparation

- (1) Remove shank nuts (Ref.SB.0L.593-72-8896-347) is required (Ref.72-09-00 Repair).
- (2) Remove the protective coating, if not already removed during cleaning, using cleaning process F (Ref. 72-09-00 Cleaning).
- (3) De-rust using process H (Ref.72-09-00 Cleaning).

B. Machine

- (1) Locate the rotor shaft rear to a cylinder grinding machine and set true.
- (2) Finish grind the front and rear faces of the flange, removing the minimum amount of material necessary to remove all traces of corrosion. Refer to Figure 401 for maximum machining allowances. The following conditions must be observed:

Grinding wheel : A60K grit range 46-80 grade range J-L

Coolant : GP soluble oil 60 to 1 dilution

Speed : 100 ft/min (30,5 m/min)

Feed : 0.0005 in.(0,013 mm) per rev.

CMT

- (3) Remove burrs and sharp edges.

C. Inspect

- (1) Inspect for the satisfactory completion of the machining operation.

LP COMPRESSOR ROTOR - ROTOR SHAFT FRONT
LABYRINTH FINS RESTORED BY TIG WELDING

MODIFICATION NO. OL.8900C1. Effectivity

<u>IPC</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-31-03	1 90	B.916195, B.922809, B.925001, B.930060, B.930173.

2. Introduction

A. General.

- (1) This repair describes the procedure for restoring labyrinths number 1, 2a and 2b by mechanised TIG welding and machining to the standard dimensions.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES) in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair for all standard practices applicable to this repair.
- (4) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (6) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (7) Surface texture is to be 125 micro-inches (3,2 micrometres) unless otherwise stated.
- (8) All tools referred to by item number in procedural steps are detailed in para.4.
- (9) Protect the component against corrosion after each operation, and place in a container for protection against damage during transit between operations.

REPAIR

MK.610-14-28 SNECMA
OVERHAUL

- (10) A test piece shall be produced and subjected to metallurgical examination; test pieces are required initially and upon any subsequent change of airline operator, sub-contractor, machine or locality. Test pieces are also required after every ten component repairs or annually, where time elapsed between component repairs exceeds one year.

3. Test Piece

A. Produce Test Piece.

- (1) Produce a test piece from fully heat-treated MSRR.8634 material to the dimensions given in Fig.401.
- (2) It is permissible to use an unserviceable standard part as a test piece. In this case, machine the labyrinth fins to the dimensions given in Fig.403.
- (3) Remove burrs and sharp edges from the fins.
- (4) Inspect for cracks using the F2A fluorescent dye penetrant process specified in Chapter 72-09-00 Inspection/Check.

B. Weld Test Piece.

- (1) Build up the single fin to a minimum height of 0.075 in. (1.91 mm) as indicated in Figure 401 by mechanised TIG welding using filler rods OMat 366 as instructed in TSD 594 OP 409. For welding data, refer to paragraph 7.
- (2) Build up the blanket weld with a single weld run only, as indicated in Figure 401 by mechanised TIG welding using filler rods OMat 366 as instructed in TSD 594 OP 409. For welding data, refer to paragraph 7.

C. Machine.

- (1) Locate the test piece in a lathe and machine the blanket weld only, removing the minimum material, until the surface is free of defects, e.g. voids, porosity, etc.

D. Inspect

- (1) Inspect for cracks using the F2A fluorescent dye penetrant process specified in Chapter 72-09-00 Inspection/Check.

E. Weld.

- (1) Repeat operations in paras. 3B(2) to 3D until the minimum build-up is achieved (Ref.Fig.401).

F. Identify.

- (1) Mark B509249 on the test piece using vibro-percussion marking as instructed in Chapter 72-09-00 Repair.

G. Inspect.

- (1) Inspect the blanket weld only, using the ultrasonic C-scan process as specified in Chapter 72-09-00 Inspection/Check.

H. Metallurgical Examination.

NOTE: The following examination must be carried out by the controlling laboratory.

- (1) Produce four suitable micro-sections at 90 deg. from the test piece surface.
- (2) Subject the micro-sections to a VPN hardness check using a 5 kg load and 2/3rds objective at 0.020 in. (0,51 mm) increments, traversed across the micro-sections. Check that the heat affected zone is limited to the area shown in Figure 401 (test piece) or Figure 406 and 407 (unservicable standard part).

4. Instructions

A. Machine.

- (1) Locate the rotor shaft front on a centre-lathe, with the large flange secured to a faceplate. Set true to datum diameters A and B (Ref.Fig.402).
- (2) Machine the seal fins of the No's.1, 2a and 2b labyrinths to the dimensions given in Figure 403.
- (3) Remove burrs and sharp edges.

**OLYMPUS 593**MK.610-14-28 *sneema*
OVERHAUL**B. Inspect.**

- (1) Inspect for the satisfactory completion of the machining operation.
- (2) Inspect for cracks using the fluorescent dye penetrant process detailed for this component in Chapter 72-31-03 Inspection/Check.
- (3) Measure and record the position of the fins on the labyrinths No's.2a and 2b (Ref.Fig.405).

C. Weld.

- (1) Build-up the fins of the No's.2a and 2b labyrinths as indicated in Figure 404, by mechanised TIG welding using filler rods OMat 366 as instructed in TSD 594 OP 409. Weld build-up must be sufficient to allow finish dimensions to be achieved (Ref.Fig.402 and 407). For welding data, refer to paragraph 7.
- (2) Build-up the No.1 labyrinth location as indicated in Figure 404, by a single weld run only, using mechanised TIG welding with filler rods OMat 366 as instructed in TSD 594 OP 409. For welding data, refer to paragraph 7.

D. Machine.

- (1) Locate the shaft on a centre-lathe with the large flange secured to a faceplate. Set true to datum diameter A and B (Ref.Fig.402).
- (2) Machine the No.1 labyrinth seal location, removing the minimum material, until the surface is free of all defects, e.g. voids, porosity etc.

E. Inspect.

- (1) Inspect the No's.1, 2a and 2b seal locations using the fluorescent dye penetrant process specified for this component in Chapter 72-31-03, Inspection/Check.

F. Weld.

- (1) Repeat the welding, machining and inspection operations for labyrinth No.1 only as instructed in paragraphs 4C(2), 4D and 4E, until sufficient material is built up to achieve the finish dimensions (Ref. Fig.402 and 406).

G. Inspect.

- (1) Inspect the shaft for distortion (Ref.Fig.402).
- (2) Inspect the welding as detailed in TSD 594 OP 409.
- (3) Inspect the shaft using the fluorescent dye penetrant process specified for this component in Chapter 72-31-03 Inspection/Check.
- (4) Inspect the No.1 labyrinth location using the ultrasonic C-scan process as specified in Chapter 72-09-00 Inspection/Check.

H. Machine.

- (1) Locate the shaft on a centre-lathe with the large flange secured to a faceplate. Set true to datum diameter A and B (Ref.Fig.402).
- (2) Finish machine the fins of No's.2a and 2b labyrinths using form tool ref. tool item 1, to the dimensions given in Figure 407. Use the dimensions previously recorded (para.48(3)) to ensure that the maximum step is 0.005 in. (0,13 mm) (Ref.Fig.407 view AA).
- (3) Finish machine the No.1 labyrinth (windback seal) using form tool ref. tool item 2, to the dimensions given in Figure 406.

J. Inspect.

- (1) Inspect for the satisfactory completion of the machining operation.
- (2) Chemically etch the repaired areas as instructed in Chapter 72-09-14 Repair, using Solution A.

- (3) Inspect the shaft using the fluorescent dye penetrant process specified for this component in Chapter 72-31-03 Inspection/Check.

K. Vapour Blast.

- (1) Mask off the shaft with suitable waterproof masking tape. Ensure that only the repair area is exposed.
- (2) Vapour blast the labyrinth fins as instructed in Chapter 72-09-13 Repair, using 320/400 mesh aluminium oxide grit at Almen 2N intensity minimum.

L. Identify.

- (1) Mark the appropriate salvage number (Ref. Table 401) adjacent to the existing part number, using electrochemical or vibro-percussion marking as specified in Chapter 72-09-00 Repair.

SALVAGE NO.	LABYRINTH NO.	TEST PIECE
B488673	1	B509249
B488674	2a	B509249
B488675	2b	B509249

Table 401

M. Final Inspection.

- (1) Finally inspect the shaft to ensure that the repair has been carried out satisfactorily and that the shaft is in a serviceable condition.

OVERHAUL.

- 3) Locate component on centre lathe and set true to datum diameter A. Refer fig.401
- 4) Machine damaged labyrinth fins to the dimensions given. Hand blend to remove burrs and sharp edges. Refer fig.402 and 403
- 5) Crack detect machined areas. Refer Overhaul Manual Chapter 72-31-03 Inspection/Check
- 6) Measure and record position of the number 3 and 4 labyrinth fins. Refer fig.404
- 7) Build up number 3 and 4 labyrinth fins by mechanised T.I.G. welding. Weld build-up must be sufficient to allow finished dimensions to be achieved. Refer TSD.594 OP.409 Use filler rods OMat 306 Refer Para.6.A and B Data. Refer fig.405
- 8) Build up number 5 labyrinth location by mechanised T.I.G. welding. Weld build-up must be sufficient to allow finished dimensions to be achieved. Refer TSD.594 OP.409 Use filler rods OMat 306 Refer Para.6.C Data. Refer fig.405
- 9) Locate component on centre lathe and set true to datum diameter A. Refer fig.401
- 10) Machine number 5 labyrinth location, removing the minimum amount of material, until the surface is free of all defects, e.g. voids, porosity etc.
- 11) Carry out dimensional checks to ensure that sufficient depth of weld has been deposited.
- 12) If necessary, repeat ops. 8 to 11 for the number 5 labyrinth location, until sufficient material is built up to achieve finished dimension.

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

Blending is limited to removal of high metal and sharp edges only.

This Repair Instruction may be embodied any number of times provided that the maximum residual depth of damage does not exceed 0.025 (0,64) after removal of high metal.

This repair instruction may be embodied to any number of dee head bolt location positions.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimetres)

Tolerances on machined dimensions plus/minus .010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 125 (3,2) Microinches (Micrometres)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

4. REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

- 1) Using hand tools only, carefully blend to remove high metal and sharp edges only. Remove the minimum amount of material necessary. Residual depth of defect(s) after removal of high metal 0.025 (0,64) maximum.

Refer figs 401 to 403.
Refer para.2. REPAIR LIMITATIONS.
Refer para.6. DATA.

CAUTION: If during metal removal, blending or polishing, the material exhibits discolouration due to local overheating, the component must be referred to the local controlling laboratory for assessment by etching and metallurgical examination.

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

A test sample is required for validation purposes prior to the initial repair and any subsequent change of process, sub-contractor or locality. Details of the validation test requirements should be obtained by writing to the Repair Authority at Rolls-Royce Plc.

It is not permissible to repair spacers where the labyrinth fins are worn below these diameters:

Stage 1-2:- 11.715(297,56)
Stage 2-3:- 14.065(357,25)
Stage 3-4:- 16.265(413,13)
Stages 4-5, 5-6, 6-7:- 16.260(413,00)

LP COMPRESSOR DRIVE SHAFT - REPAIR
DRIVE SHAFT FRONT LABYRINTH FINS
REPAIRED BY ROLL FORMING

MODIFICATION NO.OL.8326C, OL.8807C

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-31-04 .	1 210A	B.922582, B.922583, B.922588, B.922593
	210B	B.926912
	210C	B.933251, B.933259, B.933260, B.933261, B.933262, B.933263

2. Introduction

- A. This Repair describes the procedure for restoring defective labyrinth fins on the LP compressor drive shaft front, in order to maintain the fin/housing clearances of labyrinth No.9A and No.9B. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus on illustrations:
INCHES (MILLIMETRES).
- D. Protect the component against corrosion after each operation, and place in a container for protection against damage during transit between operations (Ref.72-09-20 Repair).

3. Repair Limitations

- A. Fins which have previously been repaired by welding must not be restored by roll forming.
- B. The first repair to each LP compressor drive shaft front must be carried out in accordance with paragraph 4. Subsequent repairs must be carried out in accordance with paragraphs 4 and 5.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.4 and 5).

REPAIR
72-31-04
Repair No.1
Page 401
Dec 1/91

OLYMPUS 593
MK.610-14-28
OVERHAUL

4. Summary of Operations

- A. Secure the large end of shaft to the centre-lathe face-plate; use dummy centre (Item 6) at the small end. Set the shaft true on datum diameter A and PC diameter A (Ref.Fig.401).
- B. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimension (Ref.Fig.402). A localised "witness" not exceeding 0.003 in. (0,076 mm) in depth, is acceptable on each fin.
- C. Carefully remove any burrs.
- D. Apply the roll forming technique to increase the diameter of defective fins to the specified dimension (Ref.Fig.403).
- E. Remove any folds by careful blending (Ref.Fig.403).
- F. Crack test the shaft using the magnetic particle detection method detailed for this component in 72-31-04, Inspection/Check.
- G. Finish machine the fins (Ref.Fig.401); a maximum of 1.000 in. (25,4 mm) of the circumference which has not cleaned up is acceptable on each fin.
- H. Polish fins to remove sharp edges.
- J. Repeat the test for cracks (para.F.).
- K. Identify repair. Mark the repair scheme number SAL B.478090 or R1 close to the standard part number on the drive shaft. For the second repair, mark /2 against the existing repair scheme number.

5. Amended dimensions for repeated rolling of No.9A and 9B labyrinth fins

- A. Machining dimensions before roll forming (Ref.Fig.402) may be reduced to 2.2345 in. (56,756 mm) minimum, if necessary.

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

End serration minor damage:-

Gouge damage to a maximum 0.030(0,76) deep by 0.020(0,51) wide by 0.200(5,08) long may be blended/polished.

The maximum number of serrations with minor damage must not exceed twelve.

Gouges and blending must not encroach into the serration radius.

End serration major damage:-

Major damage is gouge damage in excess of the above limits and requires complete removal of serration.

Gouges must not encroach into the serration radius.

The maximum length of complete removal of serration must not exceed 0.350(8,89).

The maximum number of serrations with major damage must not exceed six.

Blending to remove serration must not extend below 4.144(105,26) minimum diameter or encroach into the serration radius.

Page 401

Jun 1/96

**OLYMPUS 593**MK.610-14-28 SNECMA
OVERHAUL**2. REPAIR LIMITATIONS (CONTINUED)**

Serration flank scoring damage:-

The maximum depth of a score must not exceed 0.012(0,30).

The maximum length of a score must not exceed 2.500(63,50).

The maximum total blended length of serration scoring must not exceed 15.000(381,00).

Scoring and blending must not encroach into the serration radius.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimetres)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 63 (1,6) Microinches (Micrometres)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

4. REPAIR PROCEDURE**SUPPLEMENTARY INFORMATION**

- 1) Magnetic particle inspect the serrations and surrounding area.
- 2) Visually inspect to establish areas of damage.
- 3) Temporarily mark up location of damaged areas to be blended.
- 4) Blend to remove damage. Remove minimum amount of material. All blends to be smooth and continuous.
- 5) Polish blended areas to achieve required surface finish.

2. Introduction

A. General.

CAUTION: COMPLIANCE WITH ALL ASPECTS OF THIS REPAIR PROCESS SHALL BE ACHIEVED WITHOUT DEVIATION. WHERE A NEED TO DEVIATE IS CONSIDERED NECESSARY REFERENCE SHALL BE MADE TO THE REPAIR AUTHORITY FOR AGREEMENT.

- (1) This repair describes the procedure for restoring the labyrinths number 9a and 9b by mechanised TIG welding, and machining to the standard dimensions.
- (2) Dimensions are shown thus; INCHES (MILLIMETRES) in tables and illustrations.
- (3) Refer to Chapter 72-09-00 Repair, for all standard practices applicable to this repair procedure.
- (4) A test piece shall be produced and subjected to metallurgical examination; test pieces are required initially and upon any change of airline operator, sub-contractor, machine or welding equipment. Test pieces are also required after every ten component repairs or annually, where time elapsed between component repairs exceeds one year.

sneema

OVERHAUL

- (5) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (6) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (7) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (8) Surface texture is to be 63 micro-inches (1,6 micro-meters) unless otherwise stated.
- (9) All tools referred to by item number in procedural steps are detailed in para.5.
- (10) Protect the component against corrosion after each operation, and place in a container for protection against damage during transit between operations (Ref 72-09-20 Repair).

3. Test Piece

A. Produce Test Piece.

- (1) Produce a test piece from fully heat-treated MSRR.6542 material to the dimensions given in Figure 401. It is permissible to use an unserviceable standard part as a test piece. In this case, machine the labyrinth fins to the dimensions given in Figure 402.
- (2) Remove the sharp edges from the fin.
- (3) Inspect for cracks using the F2A fluorescent dye penetrant process specified in Chapter 72-09-00 Inspection/Check.

B. Weld Test Piece.

- (1) Build up the single fin to a minimum height of 0.060 in. (1,52 mm) as indicated in Figure 401 by mechanised TIG welding using filler rods OMat 3/54 as instructed in TSD 594 OP 409. For welding data, refer to paragraph 7.

C. Heat Treat.

- (1) Heat treat the test piece in an argon gas atmosphere at 580 deg.C plus/minus 5 deg.C for one hour. Cool in air.

OVERHAUL

D. Identify.

- (1) Mark B.497477 on the test piece using vibro-percussion marking as instructed in Chapter 72-09-00 Repair.

E. Metallurgical Examination.

NOTE: The following examination must be carried out by controlling laboratory.

- (1) Produce four suitable micro-sections at 90 deg. from the test piece surface.
- (2) Subject the micro-sections to a VPN hardness check using a 5 kg load and a 2/3rds objective at 0.020 in. (0,51 mm) increments, traversed across the micro-sections. Check that the heat affected zone is limited to the area shown in Figure 401 (test piece) or Figure 405 (unservicable standard part).

4. Instructions

A. Preparation.

- (1) Remove the aluminium paint from the LP compressor drive shaft, if not already removed by cleaning, using cleaning process F (Ref. TSD594 OP.114).

B. Inspect.

- (1) Inspect the shaft using the magnetic particle process specified for this component in Chapter 72-31-04 Inspection/Check.

C. Machine.

- (1) Locate the shaft on a centre-lathe, with the large flange secured to a faceplate and the small end located by a dummy centre ref. tool item 1, and set true.
- (2) Machine the seal fins of the No's. 9a and 9b labyrinths to the dimensions given in Figure 402.
- (3) Remove burrs and sharp edges.

D. Inspect.

- (1) Inspect for the satisfactory completion of the machining operation.
- (2) Inspect for cracks using the magnetic particle process detailed for this component in Chapter 72-31-04 Inspection/Check.
- (3) Measure and record the position of the fins on labyrinths No's.9a and 9b (Ref.Fig.403).

E. Weld.

- (1) Build up the fins of the No's.9a and 9b labyrinths as indicated in Figure 404, by mechanised TIG welding using filler rods OMat 3/54 as instructed in TSD 594 OP 409. Weld build-up must be sufficient to allow finish dimensions to be achieved (Ref.Fig.404). For welding data, refer to paragraph 7.

F. Inspect.

- (1) Inspect the shaft using the magnetic particle process specified for this component in Chapter 72-31-04, Inspection/Check.

G. Heat Treat.

- (1) Heat treat the shaft in an inert gas or vacuum furnace at 580 deg.C. plus/minus 5 deg.C. for one hour. Cool in air.

H. Inspect.

- (1) Inspect the welding as detailed in TSD 594 OP 409.
- (2) Inspect the shaft using the magnetic particle process specified for this component in Chapter 72-31-04, Inspection/Check.

J. Machine.

- (1) Locate the shaft on a centre-lathe with the large flange secured to a faceplate and the small end located by a dummy centre ref. tool item 1, and set true.

- (2) Finish machine the fins of No's.9a and 9b labyrinths using form tool ref. tool item 2, to the dimensions given in Figure 404. Use the dimensions previously recorded (para.40(3)) to ensure that the maximum step is 0.002 in. (0,05 mm) (Ref.Fig.404 view AB).

K. Inspect.

- (1) Inspect for the satisfactory completion of the machining operation.
- (2) Inspect the shaft using the magnetic particle process specified for this component in Chapter 72-31-04 Inspection/Check.

L. Identify.

- (1) Mark SAL B.488627 or R3 adjacent to the existing part number, using vibro-percussion marking as specified in Chapter 72-09-00 Repair.

M. Protect.

- (1) Apply high heat resisting aluminium enamel to the shaft as instructed in Chapter 72-09-04 Repair.

N. Final Inspection.

- (1) Finally inspect the shaft to ensure that the repair has been carried out satisfactorily and that the shaft is in a serviceable condition.

Compliance with all aspects of this Repair Process shall be achieved without deviation. Where a need to deviate is considered necessary reference shall be made to the Repair Authority for agreement.

This instruction gives the procedure for the blending of damage on the bolt locating diameter on the Shaft, Assembly of, Drive, Compressor LP.

Source demonstration is not necessary for this repair.

This instruction may be applied any number of times provided that the maximum residual depth of damage does not exceed 0.035 (0,89) after removal of high metal.

3. GENERAL**UNLESS OTHERWISE SPECIFIED**

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

End serration minor damage:-

Gouge damage to a maximum 0.030(0,76) deep by 0.020(0,51) wide by 0.200(5,08) long may be blended/polished.

The maximum number of serrations with minor damage must not exceed twelve.

Gouges and blending must not encroach into the serration radius.

End serration major damage:-

Major damage is gouge damage in excess of the above limits and requires complete removal of serration.

Gouges must not encroach into the serration radius.

The maximum length of complete removal of serration must not exceed 0.350(8,89).

The maximum number of serrations with major damage must not exceed six.

Machining to remove serration must not extend below 4.144(105,26) minimum diameter or encroach into the serration radius.

2. REPAIR LIMITATIONS (CONTINUED)**Serration flank scoring damage:-**

The maximum depth of a score must not exceed 0.012(0,30).
The maximum length of a score must not exceed 2.500(63,50).
The maximum total blended length of serration scoring must not exceed 15.000(381,00). For any group of 6 adjacent teeth, the maximum total length of blended flank must not exceed 7.500(190,50).
Scoring and blending must not encroach into the serration radius.

3. GENERAL**UNLESS OTHERWISE SPECIFIED**

Drawing practice & tolerance interpretation to ISO1101 (JES160)
Dimensions in Inches (Millimetres)
Tolerances on machined dimensions plus/minus 0.010 (0,25)
Tolerance on angles plus/minus 2 degrees
Break sharp edges 0.004 to 0.020 (0,1 to 0,5)
Surface texture interpretation to ISO1302 (JES137)
Surface texture to be 63 (1,6) Microinches (Micrometres)
Welding symbols to ISO2553 (JES139)
3rd Angle Projection

4. REPAIR PROCEDURE**SUPPLEMENTARY INFORMATION**

- 1) Magnetic particle inspect the serrations and surrounding area.
- 2) Visually inspect to establish areas of damage.
- 3) Temporarily mark up location of damaged areas to be blended/machined.

Refer Overhaul Manual
Chapter 72-31-04

Refer Overhaul Manual
Chapter 72-31-04
Inspection/Check.

FOR MAJOR END SERRATION DAMAGE PROCEED AS FOLLOWS, FOR ALL OTHER DAMAGE REFER TO OPERATION 8.

- 4) Locate component to a suitable machine, set true and secure.
- 5) Mill to remove damage from serration(s).
- 6) Remove all burrs and sharp edges from milled serration(s).

Refer to Figs.401 and 402.

Refer to Figs.401 and 402.
Refer to Para.6 Data.

Refer to Figs.401 and 402.

- 7) Visually and dimensionally inspect milled serration(s). Refer to Figs.401 and 402.
- 8) Blend to remove damage. Refer Repair Limitations. Remove minimum amount of material. Refer Overhaul Manual Chapter 72-09-22 Repair. All blends to be smooth and continuous. Use hand tools only. Refer Figs.401 and 402.
- 9) Polish blended areas to achieve required surface finish.
- 10) Magnetic particle inspect all repaired areas. Refer Overhaul Manual Chapter 72-31-04
- 11) Mark Repair Instruction number RI B517842 or R6 on component, adjacent to normal 'assembly of' number, using the vibro-percussion engraving technique. Refer Overhaul Manual Chapter 72-09-00 Repair.

COMPRESSOR INTERMEDIATE CASE - REPAIR
LABYRINTH STATIC RING FINS
REPAIRED BY ROLL FORMING

1. Effectivity

<u>IPC</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-32-00	5 30A	B.484334
	30A	B.492650
	30B	B.494286

2. Introduction

- A. This Repair describes the procedure for restoring defective fins on the labyrinth static ring, in order to maintain the standard fin/housing clearances of labyrinth No.10A. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus on illustrations:
INCHES (MILLIMETRES).

3. Repair Limitations

- A. This Repair may be applied once only.
- B. Fins which have previously been repaired by welding must not be restored by roll forming.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.3.B).

4. Summary of Operations

- A. Secure the labyrinth ring to the faceplate of an external grinder and set true on datum diameter A (Ref.Fig.401).
- B. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimensions (Ref. Fig.402). A localised "witness", not exceeding 0.003 in. (0,076 mm) in depth, is acceptable on each fin.

OVERHAUL

- C. Carefully remove any burrs.
- D. Apply the roll forming technique to increase the diameter of defective fins to the specified dimensions (Ref. Fig.403).
- E. Remove any folds by careful blending (Ref.Fig.403).
- F. Crack test the labyrinth ring using the magnetic particle detection method detailed for this component in 72-32-00, Inspection/Check.
- G. Finish machine the fins (Ref.Fig.401); a maximum of 1.000 in. (25,4 mm) of the circumference which has not cleaned up is acceptable on each fin.
- H. Polish the fins to remove sharp edges.
- J. Repeat the test for cracks (para.F).
- K. Identify repair. Mark the repair scheme number SAL B.478093 close to the standard part number on the labyrinth ring.

COMPRESSOR INTERMEDIATE CASE ASSEMBLY - REPAIR
REAR OUTER AIR BAFFLE UNIT REPAIRED BY FITTING REPLACEMENT
OUTER LABYRINTH HOUSING

1. Effectivity

<u>IPC</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-32-00	2 30C	B.491796
	2 30C	B.492612
	2 30D	B.494278

2. Introduction

- A. This Repair describes the procedure for fitting a standard replacement outer labyrinth housing to the rear outer air baffle unit, in order to maintain the standard fin/housing clearances of labyrinth No.8.
- B. Refer to Chapter 72-09-00, Repair for all standard practices and tolerancing applicable to this repair procedure.
- C. Dimensions are shown thus on illustrations:
INCHES (MILLIMETRES).
- D. Machining surface texture to be 63 micro-inches
(1,6 micrometers) unless otherwise stated.

3. Summary of Operations

- A. Strip the rear outer baffle unit of all aluminium paint
(Ref.72-09-00 Cleaning Process F).
- B. Remove the Defective Outer Labyrinth Housing.
 - (1) Set up the fixture (item 2) in a centre-lathe.
Locate the air baffle on the base plate of the fixture
on datum face A and clock true on datum bore B
(Ref.Fig.402).
 - (2) Part-off the labyrinth housing and turn the baffle
back to the specified dimension (Ref.Fig.401).
 - (3) Remove the component from the fixture; remove all
burrs and sharp edges.

NOTE: If convenient, leave the fixture in position
on the lathe for final machining operations.

sneema

C. Inspect the Air Baffle.

- (1) Inspect the component for satisfactory completion of the previous operations.
- (2) Test for cracks by the fluorescent penetrant process specified for this component in 72-32-00, Inspection/Check.

D. Prepare Components for Welding.

- (1) Inspect the replacement housing for satisfactory condition; record the batch and serial numbers.
- (2) Clean and degrease the areas to be welded, by abrading with Scotchbrite and vapour degreasing, or by cleaning with a group 2, 3 or 4 solvent (Ref.72-09-00 - Cleaning).

E. Weld Components.

- (1) Locate the new labyrinth housing on the air baffle; use expanding ring (item 1).
- (2) Argon-arc tackweld the labyrinth housing to the air baffle.
- (3) Remove the expanding ring.
- (4) True-up mating edges preparatory to final welding.
- (5) Autogenous inert-gas weld the labyrinth housing to the air baffle.

NOTE: Ensure that sufficient allowance is left for final machining in unit form.

- (6) If necessary, dress the weld (Ref.Fig.402); remove heat discolouration.

F. Inspect the Air Baffle.

- (1) Examine the new welded joint by the radiographic (X-ray method).
- (2) Repeat the crack test.

G. Heat Treat the Air Baffle.

- (1) Heat the air baffle to 650°C (plus/minus 10°C); soak at this temperature for one hour.

REPAIR

72-32-00

Repair No.8

Page 402

Jun 1/96

OLYMPUS 593

MK.610-14-28

OVERHAUL

(2) Cool the baffle in air.

H. Repeat the Crack Test.

J. Inspect the Baffle before Machining.

(1) Inspect the baffle to ensure that adequate allowance remains for final machining.

K. Machine to Final Dimensions.

(1) If the fixture (item 2) was removed after operation 2B, reset the fixture in the centre-lathe.

(2) Locate the air baffle in the fixture on datum face A, (Ref.Fig.402) and set true.

(3) Clean up small end face.

(4) Finish turn datum bore B to specified dimensions, (Ref.Fig.402).

(5) Relocate the component in the fixture and set true to datum bore B.

(6) Finish turn the end face of datum bore B to produce the dimension 1.784 in./1.782 in. (45,314 mm/45,263 mm) from datum face A, (Ref.Fig.402).

(7) Finish turn the diameter 8.365 in./8.360 in. (212,471 mm/212,344 mm), (Ref.Fig.402), to length 0.130 in./0.132 in. (3,302 mm/3,353 mm) and form the corner radius 0.030 in. (0,762 mm), (Ref.Fig.403).

(8) Finish form the 31 deg/30 deg and 30 deg angles (Ref.Fig.403) to produce the diameter 8.530 in. (216,662 mm); form the corner radii.

NOTE: A step of 0.010 in. (0,254 mm) (maximum) is permissible.

(9) Chamfer datum bore B 0.040 in. (1,016 mm) x 45 deg, (Ref.Fig.403). Remove burrs.

(10) Inspect for satisfactory completion of all previous operations.

(11) Locate the component on fixture (item 2) on datum face A. Set true on datum bore B.

REPAIR

72-32-00

Repair No.8

Page 403

Jun 1/92

**OLYMPUS 593**

MK.610-14-28

OVERHAUL

- (12) Finish form and face 31 deg/30 deg angle to produce 0.236 in./0.234 in. (5,995 mm/5,944 mm) lip, (Ref.Fig.403), and diameter 9.380 in. (283,252 mm), (Ref.Fig.402); form the 0.100 in. (2,540 mm) corner radius.
- (13) Check 0.110 in. (2,794 mm) wall section (Ref.Fig.403); chamfer other end of datum bore B (Ref. previous operation 2K(9)).
- (14) Finish turn bore X to the specified diameter (Ref. Fig.402 and 405). Produce the dimension 0.650 in./0.640 in. (16,510 mm/16,256 mm) and form the corner radius 0.020 in. (0,508 mm), (Ref.Fig.403).
- (15) Finish turn bore Y to the specified diameter (Ref. Fig.402 and 405). Produce dimension 1.010 in./1.000 in. (25,654 mm/25,400 mm) and form the corner radius 0.020 in. (0,508 mm) (Ref.Fig.403).
- (16) Finish turn bore Z to the specified diameter (Ref. Fig.402 and 405). Produce dimension 1.370 in./1.360 in. (34,798 mm/34,544 mm) and form the 0.020 in. (0,508 mm) corner radius, (Ref.Fig.403).
- (17) Turn end face to 1.730 in./1.720 in. (43,942 mm/43,688 mm) dimension; chamfer the three bores 0.020 in./0.030 in. (0,508 mm/0,762 mm) x 45 deg, (Ref.Fig.403).
- (18) Finish turn the outside diameters of the labyrinth housing to produce 30 deg angles; maintain a wall section of 0.080 in./0.075 in. (2,032 mm/1,905 mm) at bores X and Y, and 0.060 in./0.055 in. (1,52 mm/1,40 mm) at bore Z. Produce the 1.640 in. (41,656 mm), 0.770 in. (19,558 mm) and 0.410 in. (10,414 mm) dimensions and form the 0.050 in. (12,700 mm) corner radii, (Ref.Fig.403).
- (19) Remove burrs and sharp edges.
- (20) Inspect for satisfactory completion of all previous operations.

L. Machine Offset Dimensions.

- (1) Relocate the air baffle in the fixture and set true on the offset clocking register.

**OLYMPUS 593**MK.610-14-28 SNECMA
OVERHAUL

- (2) Finish turn the specified offset dimensions and form the 0.020 in. (0,508 mm) corner radii in bores X, Y and Z, (Ref.Fig.402 and 405). Check the 0.020 in./0.030 in. (0,508 mm/0,762 mm) chamfers, (Ref.Fig.403).

M. Finish Machine Slots.

- (1) Locate the air baffle in fixture (item 2) and set true in milling machine on datum bore B.
- (2) Finish machine to width and form the corner radii in the six slots, to produce the specified dimension to the centre line, (Ref.Fig.404).
- (3) Remove all burrs and sharp edges.
- (4) Inspect for satisfactory completion of previous operations.
- (5) Repeat the test for cracks.

N. Identify repair. Mark the repair scheme number SAL B.488604 close to the standard part number on the air baffle.

P. Apply Aluminium Paint.

- (1) Mask the areas not to be painted (Ref.Fig.406).
- (2) Prepare surfaces and apply high heat resisting aluminium paint to all unmasked areas of the component. The full procedure is described in 72-09-04 Repair.
- (3) Finally view the component for the satisfactory completion of the repair.

COMPRESSOR INTERMEDIATE CASE ASSEMBLY - REPAIR
OUTER LABYRINTH HOUSING ASSEMBLY REPAIRED BY FITTING NEW
LABYRINTH HOUSING

1. Effectivity

<u>IPC</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-32-00	1 350C	B.491792
	1 350D	B.494281

2. Introduction

- A. This Repair describes the procedure for fitting a replacement labyrinth housing to the outer labyrinth housing assembly, in order to maintain the standard fin/housing clearances of labyrinth No.3.
- B. Refer to Chapter 72-09-00, Repair for all standard practices and tolerancing applicable to this repair procedure.
- C. Dimensions are shown thus on illustrations: INCHES (MILLIMETRES).
- D. Machining surface texture, unless otherwise stated, to be 63 MICROINCHES (1,6 MICROMETRES).

3. Summary of Operations

- A. Strip the labyrinth housing of all aluminium paint (Ref.72-09-00, Cleaning Process F).
- B. Remove Defective Section of Component.
 - (1) Set up the fixture (item 1) in a centre-lathe. Locate and secure the component in the fixture on datum face A and clock true on datum bore B (Ref. Fig.402).
 - (2) Cut off the defective section and face back to the specified dimension (Ref.Fig.401).
 - (3) Remove burrs and sharp edges.

OLYMPUS 593

MK.610-14-28

OVERHAUL

SNECMA

- (4) Inspect the component for satisfactory completion of previous operations.
- (5) Test the housing for cracks by the method specified for this component in 72-32-00, Inspection/Check.

4. Fit Replacement Labyrinth Housing

A. Prepare Components for Welding.

- (1) Inspect the replacement housing for satisfactory condition; record the batch and serial numbers.
- (2) Clean and degrease the areas to be welded by abrading with Scotchbrite and vapour degreasing, or by cleaning with a group 2, 3 or 4 solvent (Ref.72-09-00 - Cleaning).

B. Weld Components.

- (1) Assemble the components in the welding fixture (item 2) and check for correct alignment.
- (2) Argon-arc tackweld the components.
- (3) Remove the assembly from the fixture.
- (4) True-up mating edges preparatory to final welding.
- (5) Autogenous inert-gas weld the tacked joint.
- (6) Remove any heat discolouration from the component.

C. Inspect the Labyrinth Housing Assembly.

- (1) Examine the new welded joint by the radiographic (X-ray) method.
- (2) Repeat the crack test.

D. Heat Treat the Labyrinth Housing.

- (1) Heat the housing to 650 deg C (plus/minus 10 deg C); soak at this temperature for one hour.
- (2) Cool the housing in air.

E. Repeat the crack test.

Jun 1/96

OLYMPUS 593

MK.610-14-28
OVERHAUL

F. Inspect the Assembly Before Machining.

- (1) Ensure that adequate allowance remains for final machining.
- (2) Check for distortion; if necessary, dress to rectify.
- (3) Repeat the crack test.

G. Machine to Final Dimensions.

- (1) Set up the fixture (item 1) in a centre-lathe.
- (2) Locate the labyrinth housing in the fixture on datum face A (Ref.Fig.402) and set true.
- (3) Clean up small end face.
- (4) Finish turn datum bore B to specified dimensions (Ref.Fig.402).
- (5) Re-locate the housing in the fixture and set true to datum bore B.
- (6) Finish turn the end face of bore B to produce the dimension 2.630 in./2.628 in. (66,802 mm/66,751 mm) from the lug faces (Ref.Fig.402).
- (7) Finish turn the diameter 8.365 in./8.360 in. (212,471 mm/212,344 mm) (Ref.Fig.402), to length 0.130 in./0.132 in. (3,302 mm/3,353 mm) and form the corner radius 0.030 in. (0,762 mm) (Ref. Fig.403).
- (8) Finish form the 31 deg/30 deg and 30 deg angles (Ref.Fig.403) to produce the 8.530 in. (216,662 mm) diameter (Ref.Fig.402); form the corner radii 0.100 in. (2,54 mm) and 0.500 in. (12,70 mm).

NOTE: A step of 0.010 in. (0,254 mm) (maximum) is permissible.

- (9) Chamfer datum bore B at one end 0.040 in. (1,016 mm) x 45 deg (Ref.Fig.403). Remove burrs.
- (10) Inspect for satisfactory completion of all previous operations.

OVERHAUL

- (11) Re-locate the housing in the fixture (item 1) on face A; set true to datum bore B.
- (12) Finish form and face 31 deg/30 deg angle (Ref.Fig.403) to produce 0.236 in./0.234 in. (5,995 mm/5,944 mm) lip and diameter 9.380 in. (238,252 mm) (Ref.Fig.402); form the 0.100 in. (2,54 mm) corner radii.
- (13) Check 0.110 in. (2,794 mm) wall section (Ref.Fig.403).
- (14) Chamfer other end of datum bore B (Ref. para.(9)).
- (15) Finish turn bores X, Y and Z to the specified diameters, lengths and corner radii (Ref.Fig.402 and 403).
- (16) Turn front face to produce 1.570 in./1.560 in. (39,878 mm/39,624 mm) dimension (Ref.Fig.402).
- (17) Finish turn outside diameters of labyrinth housing to produce 30 deg angles (Ref.Fig.403) and lips to dimensions 2.190 in. (55,626 mm), 0.770 in. (19,558 mm), 0.410 in. (10,414 mm) and 0.050 in. (1,270 mm) (Ref.Fig.402). Maintain wall sections of 0.080 in./0.075 in. (2,032 mm/1,905 mm) and 0.060 in./0.050 in. (1,524 mm/1,270 mm) and form 0.100 in. (2,54 mm) and 0.050 in. (1,270 mm) corner radii (Ref.Fig.403).
- (18) Remove burrs and sharp edges.
- (19) Inspect for satisfactory completion of all previous operations.

H. Machine Offset Dimensions.

- (1) Re-locate and secure the housing in fixture (item 1) and set true on the offset clocking register.
- (2) Finish turn the specified offset dimensions and form the 0.020 in. (0,508 mm) corner radii in bores X, Y and Z (Ref.Fig.402 and 403).
- (3) Remove burrs.

J. Finish Machine Slots.

- (1) Re-locate and secure the housing in the fixture (item 1) and set true in milling machine on datum bore B.

OVERHAUL

- (2) Finish machine to width and form the corner radii in the six slots, to the specified dimension to the centre line (Ref.Fig.404).
- (3) Remove burrs and sharp edges.
- (4) Inspect for satisfactory completion of previous operations.
- (5) Repeat the test for cracks.

K. Identify Repair.

Mark the repair scheme number SAL B.478062 close to the standard part number on the component.

L. Apply Aluminium Paint.

- (1) Mask joint faces AB, areas AC and surfaces enclosed by AD (Ref.Fig.405).
- (2) Prepare surfaces and apply high heat resisting aluminium paint to all unmasked areas of the component. The full procedure is described in 72-09-04, Repair.
- (3) Remove masking.
- (4) Finally view the component for satisfactory completion of the repair.

COMPRESSOR INTERMEDIATE CASE ASSEMBLY - REPAIR
INNER CASE REPAIRED BY FITTING NON-STANDARD SHOULDERED PINS

Applicable to:

Inner Case B.423988

Authority:

Modification No. OL.8423C

1. Introduction

- A. This Repair describes the procedure for repairing pin locations in the inner case by opening the defective locations to receive pins which are oversize on the fast-end diameter. Three increments of oversize are available to permit successive repairs to each location.
- B. Refer to Chapter 72-09-00, Repair for all standard practices and tolerancing applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

2. Summary of Operations

- A. Prepare Defective Locations.
 - (1) Measure the defective locations to determine the minimum oversize dimension required (Ref. Table 401); this will permit successive repairs.
 - (2) Location X only (Ref.Fig.401).
 - (a) Locate the case on its small end face on a jig boring machine.
 - (b) Set true to the defective pin location, SECTION AA.
 - (c) Finish bore the location to the selected oversize diameter.

- (d) Remove burrs and sharp edges.
 - (3) Location Y only (Ref.Fig.402 VIEW ON AB AND AD).
 - (a) Locate the case on its large end face on a jig boring machine with a universal boring head.
 - (b) Set true to vanes 5 or 6, as applicable, on inside of casing.
 - (c) Finish bore the location to the selected over-size diameter and the specified depth; form the 0.020 in./0.030 in. (0,508 mm/0,762 mm) corner radius and vanes 5 or 6.
 - (d) Remove burrs and sharp edges.
 - (4) Location Z only (Ref.Fig.402, VIEW ON AC).
 - (a) Locate the case on its large end face on a universal jig boring machine with a universal boring head.
 - (b) Set true to vane 4 on inside of casing.
 - (c) Finish bore the locations to the selected oversize diameter.
 - (d) Remove burrs and sharp edges.
 - (5) Inspect for satisfactory completion of all previous operations.
- B. Fit Oversize Fast-End Pins.
- (1) Select the correct non-standard pins for the locations prepared (Ref. Table 401).
 - (2) Freeze and fit the pins to the case.
 - (3) Inspect to ensure that all pins have been fitted correctly.
 - (4) Test the case for cracks by the fluorescent dye process specified for this component in 72-32-00 Inspection/Check.

COMPRESSOR INTERMEDIATE CASE ASSEMBLY - REPAIR
LP BEARING HOUSING SEAL LANDS REPAIRED BY
APPLICATION OF SPRAYED COATING

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-32-00	01 280A	B.487893 (Component of Sub-assy)

2. Authority:

Modification No. 0L.8423C

3. Introduction

- A. This Repair describes the procedure for repairing the LP bearing housing by building up the squeeze film lands with a sprayed on coating, in order to maintain the standard clearance between the housing and the No.2 bearing.
- B. Refer to Chapter 72-09-00 Repair for all standard practices, tolerancing and the spraying processes applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

4. Instructions

- A. Remove existing coating from the two seal lands.
 - (1) The coating may be removed by machining or a chemical process approved by the controlling laboratory.
 - (2) Inspect to ensure that existing coating has been removed completely.
- B. Grind Seal Lands (Ref.Fig.401).
 - (1) Locate and secure the housing to the faceplate of an internal grinder; clock true on datum diameter A.
 - (2) Grind the lands to the specified dimensions (Ref.VIEW 1); use diamond wheel (item 1).

OVERHAUL

- (3) Inspect to ensure satisfactory completion of operation (2).
- (4) Test the housing for cracks by the fluorescent dye process specified for this component in 72-32-00 Inspection/Check.

C. Apply Sprayed Coating.

- (1) Employ one of the following methods to apply the coating.

METHOD 1. (SAL B.492901) Plasma spray tungsten carbide cobalt (METCO 73 FNS1) on the faces identified XX and dimensions specified on Fig.401.

METHOD 2. (SAL B.492902) Detonation spray tungsten carbide (LWLN 40) on the faces identified XX and dimensions specified on Fig.401.

- (2) Submit a test piece (Ref.72-09-00 Repair) and ensure that it is accepted by the controlling laboratory before commencing grinding operations.

D. Finish Grind Sprayed Coating (Ref.Fig.401).

- (1) Locate and secure the housing to the faceplate of an internal grinder; clock true on datum diameter A.
- (2) Finish grind the two lands to the dimensions specified on VIEW 2; use diamond wheel (item 1).
- (3) Finish grind to remove surplus spray from the sides of lands and blend with existing radii; maintain the dimensions specified on the diagrammatic view.
- (4) Dress to remove surplus spray and ensure hole is free from spray; form the specified radius around the hole.
- (5) Inspect to ensure satisfactory completion of all previous operations.
- (6) Repeat the test for cracks.

OVERHAUL

COMPRESSOR INTERMEDIATE CASE ASSEMBLY - REPAIR
HP BEARING HOUSING SEAL LANDS REPAIRED BY
APPLICATION OF SPRAYED COATING

1. Effectivity

<u>Engine</u>	<u>Part Description</u>	<u>Part No.</u>	<u>Classification</u>
Olympus	Housing, Bearing H.P.	B487894	Unclassified
		B471555	Unclassified

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process shall be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

This instruction gives the procedure for restoration of squeeze film lands by re-spray coating on the Housing, Bearing H.P. by two alternative methods. Validation testing is not required for this Repair Instruction.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimetres)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 (0,1) TO 0.020 (0,5)

Machine where marked

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 32 Microinches (0,8 Micrometres)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

ALL TASKS identified in this instruction are in the Engine Overhaul Processes Manual (TSD594-J). This Repair Instruction is covered by two alternative parts.

PART A.

B492903 restores the squeeze film lands by plasma spraying with a bond coating (OMat 3/188-Metco 450NS) followed by top coating of (OMat 3/114C-Metco 73F-NS-2).

PART B.

B492904 restores the squeeze film lands by detonation spray tungsten carbide (LWIN 40, MSRR 9507/304).

4. REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

PART A - REPAIR INSTRUCTION B492903.

A. Remove the coating from the Part

- 1) Mask the area not to be processed. Refer to TASK 70-00-00-100-140.
- 2) Remove the coating from the part. Refer to TASK 70-00-00-100-107.
SUBTASK 70-00-00-860-107-056.
Use chemical stripping equipment.

B. Dry Non-Mettalic Abrasive Blast (if necessary)

- 1) Mask the area not to be processed. Refer to TASK 70-00-00-100-140.
- 2) Blast to remove any remnants of coating from the part. Refer to TASK 70-00-00-100-107.
SUBTASK 70-00-00-860-107-060.
Use OMat 184 Abrasive medium.

C. Machine the Part (Optional removal of coating)

- 1) Install the part in the grinding fixture. Refer to Fig. 401.
- 2) Grind the part to the applicable dimension. Use a grinding machine.

D. Remove burrs (If op.10 has been carried out)

- 1) Remove any burrs and sharp edges from the machined squeeze film lands. Use hand held tools.
Refer to Overhaul Manual Chapter 72-09-22 Repair.
Refer to Fig. 401.

E. Etch the Repaired Area

- 1) Do a swab etch of the repaired area to ensure complete removal of coating. Refer to TASK 70-00-00-100-133.
SUBTASK 70-00-00-110-133-001.

F. Examine the Part

- 1) Do a dimensional inspection of the part. Use inspection equipment.
Refer to Fig.401.

4. REPAIR PROCEDURESUPPLEMENTARY INFORMATIONPART A - REPAIR INSTRUCTION B492903.G. Penetrant Crack Test

- 1) Do a penetrant crack test on the repair area.

Refer to TASK 70-00-00-200-210.
SUBTASK 70-00-00-231-210-002.
Use OMat 651 Fluorescent penetrant
High sensitivity post-emulsified.
Cracks are not permitted.
Use penetrant crack test
equipment.

H. Bond Coat

- 1) Apply the bond coat to the repair area where marked XX (squeeze film lands) to a thickness of 0.003(0,076) to 0.005(0,13).

Refer to TASK 70-00-00-300-704.
SUBTASK 70-00-00-340-704-001.
Use OMat 3/188 Metal spraying
powder nickel aluminium (95/5).
Use metal spray equipment.
Refer to Fig.402 and 403.

J. Metal Spray the Part

- 1) Apply the metal spray to the repair area where marked XX (squeeze film lands) to a minimum thickness of 0.010(0,25).

Refer to TASK 70-00-00-300-704.
SUBTASK 70-00-00-860-704-057 and
SUBTASK 70-00-00-340-704-026.
OMat/3/113C Metal spraying
powder, tungsten carbide/cobalt.
Apply sufficient metal spray to
permit the part to be machined.
Use metal spray equipment.
Refer to Fig. 402 and 403.

K. Visually Inspect Sprayed Coating

- 1) Visually inspect prior to machining for evidence of blistering, lifting, cracking or chipping.

Refer to TASK 70-00-00-300-704.
SUBTASK 70-00-00340-704-001.

L. Machine the Part

- 1) Install the part in the grinding fixture.

Refer to Fig. 402 and 403.

OLYMPUS 593

MK.610-14-28
OVERHAUL4. REPAIR PROCEDURESUPPLEMENTARY INFORMATIONPART A - REPAIR INSTRUCTION B492903.

- 2) Grind the part to the applicable dimension.

Use a grinding machine.
Use the S3S15345000 Diamond Wheel 1 off.
Refer to Fig. 402 and 403.

M. Remove Burrs/Excess Spray

- 1) Remove any burrs and sharp edges. Remove any excess spray. Produce 0.030(0,76) corner radius around edge of hole.

Use hand held tools.
Refer to Overhaul Manual Chapter 72-09-22 Repair.

N. Examine the Part

- 1) Examine and measure the dimensions of the part.

Use inspection equipment.
Refer if outside limits.
Refer to TASK 70-00-00-300-704.
SUBTASK 70-00-00-340-704-063.
Refer to Fig. 402 and 403.

P. Identify the Repair and Coating

- 1) Mark on B492903 or R13A and the coating identification symbols shown below, adjacent to the part number.

Refer to Overhaul Manual Chapter 72-09-00 Repair.
Use vibration peen equipment.
Refer to Fig. 401.

PART B - REPAIR INSTRUCTION B492904.A. Remove the coating from the Part

- 1) Mask the area not to be processed.
- 2) Remove the coating from the part.

Refer to TASK 70-00-00-100-140.

Refer to TASK 70-00-00-100-140.
SUBTASK 70-00-00-860-107-056.
Use chemical stripping equipment.

4. REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

PART B - REPAIR INSTRUCTION B492904.

B. Dry Non-Mettalic Abrasive Blast (if necessary)

- | | |
|---|---|
| 1) Mask the area not to be processed. | Refer to TASK 70-00-00-100-140. |
| 2) Blast to remove any remnants of coating from the part. | Refer to TASK 70-00-00-100-107.
SUBTASK 70-00-00-860-107-060.
Use OMat 184 Abrasive medium. |

C. Machine the Part (Optional removal of coating)

- | | |
|--|---|
| 1) Install the part in the grinding fixture. | Refer to Fig. 401. |
| 2) Grind the part to the applicable dimension. | Use a grinding machine.
Refer to Fig. 401. |

D. Remove burrs (If op.24 has been carried out)

- | | |
|---|---|
| 1) Remove any burrs and sharp edges from the machined squeeze film lands. | Use hand held tools.
Refer to Overhaul Manual Chapter 72-09-22 Repair.
Refer to Fig. 401. |
|---|---|

E. Etch the Repaired Area

- | | |
|---|--|
| 1) Do a swab etch of the repaired area to ensure complete removal of coating. | Refer to TASK 70-00-00-100-133.
SUBTASK 70-00-00-110-133-001. |
|---|--|

F. Examine the Part

- | | |
|---|--|
| 1) Do a dimensional inspection of the part. | Use inspection equipment.
Refer to Fig.401. |
|---|--|

G. Penetrant Crack Test

- | | |
|--|---|
| 1) Do a penetrant crack test on the repair area. | Refer to TASK 70-00-00-200-210.
SUBTASK 70-00-00-231-210-002.
Use OMat 651 Fluorescent penetrant
High sensitivity post-emulsified.
Cracks are not permitted.
Use penetrant crack test equipment. |

4. REPAIR PROCEDURE**SUPPLEMENTARY INFORMATION****PART B - REPAIR INSTRUCTION B492904.****H. Metal Spray the Part**

- | | |
|--|---|
| 1) Apply the metal spray to the repair area where marked XX by Detonation Flame Deposition (squeeze film lands) to a minimum thickness of 0.015(0,38). | Refer to TASK 70-00-00-300-704. SUBTASK 70-00-00-860-704-057 and Use MSRR 9507/304 Tungsten Carbide (LW1N 40).
Apply sufficient metal spray to permit the part to be machined. Use metal spray equipment. Refer to Fig. 402 and 403. |
|--|---|

J. Visually Inspect Sprayed Coating

- | | |
|---|--|
| 1) Visually inspect prior to machining for evidence of blistering, lifting, cracking or chipping. | Refer to TASK 70-00-00-300-704. SUBTASK 70-00-00340-704-001. |
|---|--|

K. Machine the Part

- | | |
|--|---|
| 1) Install the part in the grinding fixture. | Refer to Fig. 402 and 403. |
| 2) Grind the part to the applicable dimension. | Use a grinding machine. Use the S3S15345000 Diamond Wheel 1 off. Refer to Fig. 402 and 403. |

L. Remove Burrs/Excess Spray

- | | |
|--|---|
| 1) Remove any burrs and sharp edges. Remove any excess spray. Produce 0.030(0,76) corner radius around edge of hole. | Use hand held tools. Refer to Overhaul Manual Chapter 72-09-22 Repair. Refer to Fig. 403. |
|--|---|

M. Examine the Part

- | | |
|--|---|
| 1) Examine and measure the dimensions of the part. | Use inspection equipment. Refer if outside limits. Refer to TASK 70-00-00-300-704. SUBTASK 70-00-00-340-704-063. Refer to Fig. 402 and 403. |

COMPRESSOR INTERMEDIATE CASE ASSEMBLY REPAIR -
FITTING REPLACEMENT SHANK NUTS TO OUTER CASE
AND RE-SWAGING EXISTING NUTS

Applicable to:

Outer Case B.491631

Authority:

Modification No. OL.8423C

1. Introduction

- A. This Repair defines the procedure for repairing outer cases in which the shank nuts are loose or defective.
- B. Refer to Chapter 72-09-00, Repair for all standard practices and tolerancing applicable to this repair procedure; the full procedure for removing and fitting shank nuts is also described in this Chapter.
- C. Dimensions are shown thus on Figure 401: INCHES.
(MILLIMETRES).

2. Summary of Operations

- A. Inspect the shank nuts for condition and security.

NOTE: A correctly swaged shank nut may be permitted partial rotation up to stop, but axial movement is not acceptable.

- B. Remove defective shank nuts; take care to avoid damage to the holes in the case.
- C. Check the condition and dimensions of nut locations in the case (Ref.Fig.401).

COMPRESSOR INTERMEDIATE CASE ASSEMBLY - REPAIR
FITTING REPLACEMENT SHANK NUTS TO INNER CASE AND
RE-SWAGING EXISTING NUTS

Applicable to:

Inner Case B.423988

Authority:

Modification No. OL.8423C

1. Introduction

- A. This Repair defines the procedure for repairing inner cases in which the shank nuts are loose or defective.
- B. Refer to Chapter 72-09-00, Repair for all standard practices and tolerancing applicable to this repair procedure; the full procedure for removing and fitting shank nuts is also described in this Chapter.
- C. Dimensions are shown thus on Fig.401: INCHES (MILLIMETRES).

2. Summary of Operations

- A. Inspect the shank nuts for condition and security.

NOTE: A correctly swaged shank nut may be permitted partial rotation up to stop, but axial movement is not acceptable.

- B. Remove defective shank nuts; take care to avoid damage to the holes in the case.
- C. Check the condition and dimensions of nut locations in the case (Ref.Fig.401).

COMPRESSOR INTERMEDIATE CASE RH GEARBOX MOUNTING -
REPAIR - RESTORE SEAL RECESS FACE

MODIFICATION NO. 8680C1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-32-00	8 220A	B.477636

2. Introduction

A. General.

- (1) This repair describes the procedure for the restoration of the seal recess on the gearbox mounting.
- (2) The damaged seal recess is machined oversize, then built up by plasma flame deposition and machined to size.
- (3) Dimensions are shown thus, in tables and illustrations: INCHES (MILLIMETRES).
- (4) Refer to Chapter 72-09-00 Repair for all standard practices applicable to this repair procedure.
- (5) Remove all sharp edges 0.004 to 0.020 in. (0,10 to 0,50 mm) unless otherwise stated.
- (6) Tolerances on machined dimensions, are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (7) Place the gearbox mounting in a suitable container for protection against damage during transit between operations.

B. Repair Limitations.

- (1) There are no limitations to the number of times this repair may be carried out on an individual component.

3. Instructions

A. Machine Recess.

- (1) Locate the component on the face plate of a suitable centre lathe and true up face X (Ref.Fig.401).
- (2) Machine to produce the pre-plasma spray dimensions shown in Fig.401.
- (3) Visually inspect the machining to ensure that the required parameters have been achieved. Remove the component from the centre lathe.
- (4) Test the component for cracks by the fluorescent dye penetrant process specified for this component in Chapter 72-32-00 Inspection/Check.

B. Plasma Flame Spray.

- (1) Mask the gearbox mounting as required, using a suitable masking tape (Ref.para.6), except the areas to be sprayed.
- (2) Plasma flame spray the area indicated in Fig.401, using the technique specified in Chapter 72-09-11 Repair, to a minimum thickness of 0.028 in. (0,50 mm) using MSRR 9507/14 spraying medium. Refer to para.6. for parameter and technique recommendations.

NOTE: Over spray is permissible only on faces X and Y, Ref.Fig.401.

- (3) Visually inspect the plasma spray deposit using the technique specified in Chapter 72-09-11 Repair. Remove masking.

C. Machine Recess.

- (1) Locate the component on the face plate of a suitable centre lathe and true up face X (Ref.Fig.401).

PRINTED IN ENGLAND

TN49323

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Machine to produce the final machining dimensions shown on Fig.401. Remove any over spray from faces X and Y.

D. Inspect.

- (1) Test the component for cracks by the fluorescent dye penetrant process specified for this component in Chapter 72-32-00 Inspection/Check.
- (2) Dimensionally check the component to ensure that all parameters have been achieved.

E. Identify.

- (1) Mark salvage B.497444 or R16 close to the standard part number, using the electro-chemical marking technique Ref. Chapter 72-09-00 Repair.

F. Finally Inspect.

- (1) Finally inspect the component to ensure the repair has been carried out satisfactorily and that the component is in a serviceable condition.
- (2) Generally clean the component to remove grease and foreign bodies, then place the component in a suitable protective container and store as required.

4. Special Tools, Fixtures and Equipment

None.

5. Replacement Parts

None.

6. Plasma Spray Parameter and Technique Recommendations

A. Technique.

(1) Preparation.

Method of cleaning: Genklene.

Grit type: Blastite No.1.

Mesh size: 18/24.

Nozzle press: 15 psi (105 kPa).

Nozzle/work distance: 2 inches/3 inches
(50,8 mm/76,2 mm).

(2) Masking.

Method: Turco 522 metallic tape.

(3) Coating.

Top coat type: Metco 443.

Thickness: 0.028 inches (0,71 mm).

Machining allowance: 0.010 inches (0,25 mm).

Gun to work distance: 5 inches/6 inches
(127,0 mm/152,4 mm).

Gun to work angle: 90 degrees/70 degrees.

(4) Cooling.

Method: Air 2 cooling nozzles.

B. Parameters.

(1) Material.

Designation and title: Metco 443NS.

Supply: Metco Ltd., Chobham, Woking, Surrey, England.

Mesh range: Minus 120 plus 325 Microns.

COMPRESSOR INTERMEDIATE CASE ASSEMBLY - REPAIR
OUTER LABYRINTH HOUSING ASSEMBLY REPAIRED BY MACHINING
DAMAGE, CAUSED BY FRETTING, FROM FACES OF BOLT LOCATIONS

MODIFICATION NO.0L.8653

1. Effectivity

<u>I.P.C.</u>	<u>Fig/Item</u>	<u>Part No.</u>
72-32-00	1/350A	B.429766
	1/350B	B.461306
	1/350C	B.491792
	1/350D	B.494281
		B.494432

2. Introduction

A. General.

- (1) This repair applies to any number of the thirty equi-spaced bolt locations of the inner attachment flange and describes the procedure for removal of damage from the face surrounding the bolt location.
- (2) Refer to 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (3) Tools referred to by item number are detailed in paragraph 4.
- (4) Surface texture is to be 125 micro-inches (3,2 micrometres).
- (5) Protect the component against corrosion after each operation and place in a container for protection against damage during transit between operations.

3. Instructions

A. Remove Fretting.

- (1) Locate the fixture (Ref. tool item 1) on a radial drilling machine and secure the outer labyrinth housing to the fixture.
- (2) Using the spotface cutter (Ref. tool item 2) remove only sufficient material to clear the damage but ensure that the minimum dimension of 0.340 in. (8,64 mm) is maintained at the spotface position.

OVERHAUL

- (3) If necessary, produce the 0.320/0.310 in (8,13/7,87 mm) diameter x 45 deg chamfer.
- (4) Remove the labyrinth housing from the holding fixture and remove sharp edges 0.020 in (0,51 mm) radius.

B. Inspect.

- (1) Visually and dimensionally inspect the labyrinth housing to ensure that all previous operations have been completed satisfactorily.
- (2) Inspect the labyrinth housing by the fluorescent dye penetrant crack detection method, using the process recommended for this component in 72-32-00, Inspection/Check.

C. Identify.

- (1) Mark SAL.B.493751 or R17 next to the existing part number, using the electro-chemical or vibro-percussion marking technique detailed in 72-09-00, Repair.

D. Finally Inspect.

Finally inspect the repair and check that the labyrinth housing is serviceable.

2. Introduction

A. General

- (1) This repair describes the procedure to restore the intermediate case Rokide 'Z' coating to a serviceable condition by re-spraying.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES), in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (4) Surface texture is to be consistent with the surrounding coating or neighbouring vane.

3. Instructions

A. Preparation

- (1) Locally degrease the case using a clean, lint-free cloth moistened with trichloroethane.
- (2) Mask off areas which do not require abrasive blasting. Protect all holes and passages, preferably by means of plugs.
- (3) Abrasive blast damaged area of coating; refer to the Overhaul Manual 72-09-24 Repair, using 18/22 mesh Alumina.

B. Spraying

- (1) Spray the damaged area as detailed in the Overhaul Manual 72-09-10 Repair, using Rokide 'Z' coat; use coating medium MSRR 9507/108. Ensure 0.025 in. (0,51/0,64 mm) thick overlap with existing coat. The total thickness of the coating on the vane is as specified in Fig.401.

C. Inspection

- (1) Inspect the coating dimensionally, for uniformity, and to ensure that there is no evidence of blistering, lifting, cracking or chipping.
- (2) If the coating is faulty it must be completely removed prior to re-processing (refer to Chapter 72-09-25 Repair, process K).

D. Finishing

- (1) Dress coating to blend it to the existing coating profile; blend out at radii as defined in Fig.401.

E. Inspect and Identify

- (1) Mark SAL.B.935534 or R18 adjacent to the part number.
- (2) Inspect to ensure that the repair has been carried out satisfactorily, and that the case is in a serviceable condition.

HP COMPRESSOR CASE AND VANES - REPAIR
OIL SUMP ASSEMBLY END TUBES RESTORED BY
PLASMA SPRAY

MODIFICATION No. OL.8869C1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-32-00	4 360	B.423701 B.497840

2. Introduction

A. General

- (1) This repair describes the procedure to restore the seal locations on the tube ends of the oil sump assembly by plasma spray.
- (2) Dimensions are shown thus: INCHES (MILLIMETRES) in tables and illustrations.
- (3) Refer to Chapter 72-09-00 Repair, for all standard practices applicable to this repair procedure.
- (4) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (6) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (7) Surface texture is to be 125 micro-inches (3,2 micro-metres) unless otherwise stated.
- (8) All tools referred to by item number in procedural steps are detailed in para.4.
- (9) Protect the component against corrosion after each operation, and place in a container for protection against damage during transit between operations.

OVERHAUL

3. Instructions

A. Machine Seal Locations (Ref.Figs.401, 402).

- (1) Locate an expanding mandrel in the chuck of a suitable lathe, and set true.
- (2) Secure the sump assembly to the expanding mandrel.
- (3) Machine the seal location, removing the minimum amount of material to remove the damage, with a minimum diameter of 1.100 in. (27,94 mm). Remove burrs and sharp edges.
- (4) Remove the sump assembly from the mandrel, and secure the sump assembly in position to machine the second seal location.
- (5) Machine the second seal location, removing the minimum amount of material to remove the damage with a minimum diameter of 1.100 in. (27,94 mm). Remove burrs and sharp edges.

B. Inspect.

- (1) Inspect for the satisfactory completion of the machining operation.
- (2) Crack test the sump assembly using the fluorescent dye penetrant process specified for this component in Chapter 72-32-00 Inspection/Check.

C. Restore Oil Seal Locations (Ref.Figs.401, 402).

- (1) Plasma Spray.
 - (a) Plasma spray the oil seal locations as detailed in Chapter 72-09-11 Repair or TSD 594 OP704, using MSRR 9507/35 material. Plasma spray thickness must be sufficient to allow for final machining to size.

D. Final Machining (Ref.Figs.401, 402).

- (1) Locate the expanding mandrel in the chuck of the lathe, and set true.
- (2) Secure the sump assembly to the expanding mandrel.
- (3) Machine the seal locations to the dimensions given in Fig.402. Remove burrs and sharp edges.

E. Inspect.

- (1) Inspect for the satisfactory completion of the plasma spray and final machining operations. Examine plasma spray coatings using 7 times magnification.
- (2) Crack test the oil sump assembly using the fluorescent dye penetrant process specified for this component in Chapter 72-32-00 Inspection/Check.

F. Identify.

- (1) Mark the salvage scheme number SAL B.502641 or R19 adjacent to the existing part number, using electro-chemical marking or vibro-percussion engraving detailed in Chapter 72-09-00 Repair.

G. Final Inspection.

- (1) Finally inspect the sump assembly to ensure that the repair has been carried out satisfactorily and that the sump assembly is in a serviceable condition.

REMOVAL AND REPLACEMENT OF ABRADABLE COATINGS

REPAIR NO. B514666

1. EFFECTIVITY

IPC	Fig./Item	Part No.
72-32-00	1 350D	B494281 B494432

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

Temporary re-protection of components between operations should be carried out in accordance with TSD 594 OP.340.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimetres)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 125 (3,2) Microinches (Micrometres)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

4. REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

- 1) Strip to remove existing aluminium paint.
NOTE: Applicable to SB.0L.593-72-8284-219 Standard only.

Refer Overhaul Manual
Chapter 72-09-00 Cleaning,
Process F.

- 2) Strip to remove existing combustion sprayed seal coatings.

Refer Overhaul Manual
Chapter 72-09-25 Repair,
using Para.L. Process A
and Process K.

REPAIR

MK.610-14-28

OVERHAUL

3) Locally swab etch seal bore locations to ensure complete removal of combustion sprayed coatings.

Refer Overhaul Manual
Chapter 72-09-14 Repair,
using Para.1.L. Solution E.

4) Crack detect.

Refer Overhaul Manual
Chapter 72-32-00
Inspection/Check.

5) Locally dry abrasive blast seal bore locations.

Refer TSD 594 OP.704 Para.6,
using OMat 1/238.

6) Combustion flame spray seal bores AA, AB and AC with bond coat 0.003/0.005 (0,08/0,13) thick.

Refer Overhaul Manual
Chapter 72-09-06 Repair
and TSD 594 OP.704 using
Nickel/Aluminium (80/20)
wire (OMat 3/90) or Nickel/
Aluminium (95/5) composite
powder (OMat 3/188).
Refer fig.402.

7) Combustion flame spray an abradable coating 0.035 (0,89) minimum thickness over the bond coating.

Refer Overhaul Manual
Chapter 72-09-06 Repair
and TSD 594 OP.704 Appendix 1
Process 019/020 using Nickel/
Graphite (75/25) powder
(OMat 3/91).

8) Identify TOP position of the Labyrinth and locate to TOP position of holding fixture and secure. Set true on a centre lathe to concentric clocking register on fixture.

Refer Para.7. TOOLS,
Item 1.
Refer fig.401 for location
of TOP marking.

9) Finish turn abradable coated bore AA producing Dia.AF to dimensions given.

Refer Para 7. TOOLS,
Item 2.
Refer Figs.401 to 404.

10) Finish turn abradable coated bore AB producing Dia.AF to dimensions given.

Refer Para.7. TOOLS,
Item 2.
Refer Figs.401 to 404.

11) Finish turn abradable coated bore AC producing Dia.AF to dimensions given.

Refer Para.7. TOOLS,
Item 2.
Refer Figs.401 to 404.

REMOVAL OF COATING PICK-UP BY DRESSING

REPAIR NO. B514799

1. EFFECTIVITY

<u>IPC</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-32-00	1 190A	FB218877
	190B	FB219733
	190C	FB219799

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

Temporary re-protection of components between operations should be carried out in accordance with TSD 594 OP 340.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimetres)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 20 (0,5) Microinches (Micrometres)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

Sharp bottomed indents greater than 0.010(0,25) in depth but less than 0.015(0,38) are acceptable for blending. Maximum final depth of depression after blending must not exceed 0.020(0,51). Refer fig.402.

Sharp bottomed indents occurring within the confines of Rokide Z coating should be blended in accordance with this instruction. Re-application of Rokide Z should be carried out in accordance with Overhaul Manual, Chapter 72-32-00, Repair No.18.

Repair of damage by blending is limited to vane aerofoil surfaces and adjacent inner case surface only. Blending must not encroach within 0.10(2,5) of vane or casing flange welds. Refer fig.401.

4. REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

- 1) Using hand tools only (no power tools permitted), carefully blend to remove all sharp bottomed impacts 0.010 to 0.015 (0,25 to 0,38) deep. Remove the minimum amount of material necessary. Maximum depth of blending 0.020 (0,51). Polish to restore surface finish.

Refer figs.401 and 402
Refer para.6. DATA.

CAUTION: If during metal removal, blending or polishing, the material exhibits discolouration due to local overheating, the component must be referred to the local controlling laboratory for assessment by etching and metallurgical examination.

- 2) Locally crack detect repaired areas.

Refer Overhaul Manual
Chapter 72-32-00
Inspection/Check

- 3) Mark Repair Instruction number RI B514784 or R26 adjacent to existing 'assy of' no. using the vibro-percussion engraving technique.

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

The Thrust Washer repaired by this instruction forms part of a matched set. For details of dis-assembly, cleaning, inspection and re-assembly, refer to the relevant section in the Overhaul Manual, Chapter 72-32-00.

This repair may be embodied any number of times provided that stated dimensions are maintained (refer fig.402, 403 and 405).

3. GENERAL

UNLESS OTHERWISE SPECIFIED

HP COMPRESSOR CASE AND VANES - REPAIR
STAGE 1 AND STAGE 2 STATOR VANE INNER FIXING RING ASSEMBLIES
REPAIRED BY FITTING REPLACEMENT LABYRINTH RING

Applicable to:

Ring Assemblies: Stage 1 B.922544
B.922960
Stage 2 B.922546
B.922961

Authority:

Modification No. OL.8384C

1. Introduction

- A. This Repair describes the procedure for fitting a standard replacement labyrinth ring to the stage 1 and stage 2 stator vane inner fixing ring assemblies in order to maintain the standard labyrinth ring/fin clearances.
- B. Refer to Chapter 72-09-00, Repair for all standard practices and tolerancing applicable to this repair procedure.
- C. Dimensions are shown thus on illustrations and in Table 401: INCHES (MILLIMETRES).

2. Summary of Operations

A. Remove the Defective Labyrinth Ring.

- (1) Remove the nuts, bolts and retaining plates from the assembly; retain these items for the reassembly procedure.
- (2) Carefully remove the defective labyrinth ring; use the extractor (item 1). Discard the labyrinth ring.
- (3) Inspect the bore B of the stator fixing ring against the appropriate dimensions (Ref.Fig.401 and Table 401).
- (4) Crack test the stator fixing ring by the fluorescent-penetrant process specified for this component in 72-33-01, Inspection/Check.

REPAIR
72-33-01
Repair No.1
Page 401
Jul 1/76

MK.610-14-28
OVERHAUL

B. Fit Replacement Labyrinth Ring.

NOTE: Use the correct location tool (Ref. paragraph 3, A and B).

- (1) Select the correct labyrinth ring for the stage 1 or stage 2 stator fixing ring assembly (Ref. Table 401).
- (2) Locate the relevant stage 1 or 2 stator fixing ring assembly to its corresponding location tool.

NOTE: Exercise care when fitting stage 2 stator fixing ring assembly as one group of the dowel holes are pitched closer together than the other 3 groups.

- (3) Heat the stator fixing ring to 170 deg C (plus/minus 10 deg C).
- (4) Assemble the new labyrinth ring to the stator fixing ring.

NOTE: Maintain the setting dimension C (Ref.Fig.401 and Table 401).

- (5) Allow the assembly to cool.
- (6) Fit the retaining plates, nuts and bolts. The correct procedure, including torque-loading, is described in 72-33-01, Sub-Assembly.
- (7) Inspect the assembly for correct fitting of the labyrinth ring.

C. Identify repair (Ref. Table 401). Mark the appropriate repair scheme number close to the standard number on the assembly.

	03 110, 120, 130 (E.G.V.)		OL.8031

2. Authority

Modification No. OL.8462C

3. Introduction

A. The text and Fig.401 of this Repair defines the blending procedure (SAL B.930289) applicable to all HP compressor stator vanes and must be read in conjunction with the specific data for each stage of vanes given on Fig.402 to 404.

B. Refer to 72-09-00 Repair for all standard practices applicable to this repair procedure.

C. Dimensions are shown thus: INCHES (MILLIMETRES).

NOTE: Blended vanes must be reassembled, spaced evenly around the stage.

4. Instructions

A. General.

- (1) Test vanes for cracks, before and after blending, by the fluorescent dye process specified for the vanes in 72-33-01 Inspection/Check; reject cracked vanes.

REPAIR

72-33-01

Repair No.2

Page 401

Nov 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Vanes with dents which deform the opposite surface of the vane are not acceptable for blending; reject vanes with this form of damage.
- (3) A blend in one zone can run out into the adjacent zone even if it infringes the blend limit for that zone, except at zone X.

B. Procedure.

- (1) Crack test vanes to determine full extent of damage. Refer to the fluorescent dye process specified for the vanes in 72-33-01 Inspection/Check.
- (2) Dress to remove damage.

CAUTION: IF MECHANICAL BLENDING METHODS ARE USED, ENSURE THAT VANES ARE NOT OVERHEATED.

- (a) Polish acceptable surface dents (Ref. para.4.(2)) to remove burrs.
- (b) Blend torn, rough or scored edges to a depth 20 per cent greater than the depth of damage, provided that specified limits are not exceeded.
- (c) If adjacent blends interfere, remove material from between them to produce a coupled blend.
- (d) Profile edge blends smoothly into the aerofoil shape (Ref.Fig.401).
- (e) Polish blends and defective areas.
- (f) Remove only the minimum amount of material consistent with specified requirements and dimensions.
- (g) In zone X, blending is permitted only as defined in (i) and (ii).
 - (i) Blend light nicking of the edges.
 - (ii) Polish out light surface scratches.
- (h) For opposing blends the chordal width must not be reduced by more than the maximum permissible blend depth.

SEE TR

- (j) Blending and polishing marks must be only in a radial direction, from root to tip.
- (k) Blend and polish to a surface finish of 32 MICROINCHES (0,8 MICROMETRES).
- (3) Clean vanes by the process specified for the vanes in 72-33-01 Cleaning.
- (4) Vapour degrease the vanes.
- CAUTION: OBSERVE THE RESTRICTION ON THE PERIOD OF IMMERSION FOR TITANIUM COMPONENTS (REF. 72-09-00 CLEANING) FOR STAGE 1 AND 2 VANES.
- (5) Etch the vanes (Ref.72-09-14 Repair).
- (a) Use Solution A for stage 1 and 2 vanes.
- (b) Use Solution B for stage 3, 4, 5, 6 and exit guide vanes.
- (c) Mask the vane roots and other areas not to be etched, with I.C.I., Stopping-off Red Lacquer F230-2006.
- (d) Etch the vanes for the minimum time required to achieve the desired surface for inspection, up to a maximum period of 20 seconds after the onset of gassing.
- (e) Remove the masking lacquer from vanes by swabbing with trichloroethane to the approved specification (Ref.72-09-00 Cleaning).
- (6) Repeat the test for cracks.
- (7) Vapour blast all the blended vanes and passivate only stages 3, 4, 5, 6 and exit guide vanes (Ref.72-09-13 Repair).
- (a) Apply masking tape to the vane roots and other areas which are not to be blasted.
- (b) Vapour blast to the Parameters for Procedure A and Special Details for Blades and Vanes specified in the vapour blasting procedure.
- (c) Remove masking tape from the vanes.

REPAIR

72-33-01

Repair No.2

Page 403

Aug 1/77

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (d) Passivate stage 3, 4, 5, 6 and exit guide vanes for a minimum period of two hours.

5. Assessment of Amount of Blending per Vane (All Stages)

- A. Vanes may be blended in several positions provided that the total extent of blending is not more than the equivalent of two blends to the maximum in zone Z.
- B. Depth of blending is controlled by zones.
- C. The maximum permissible number of blended vanes per stage, when blended to maximum limits, is identified as L on the illustrations.
- D. Where vanes are not blended to the permissible maximum, this number (Ref. para. (C)) may be increased, provided that the aggregate of the blending does not exceed L.
- E. Permissible blending is controlled by depths e.g. stage 1 vane.
- (1) 0.120 in. (3,05 mm) depth x two blends = 0.240 in. (6,10 mm) total = maximum blended vane.
- (2) This maximum may be obtained as defined in (a), (b) or (c), or by any combination of depths the total of which does not exceed 0.240 in. (6,10 mm).
- (a) 0.060 in. (1,52 mm) depth x four blends.
- (b) 0.040 in. (0,102 mm) depth x six blends.
- (c) 0.030 in. (0,76 mm) depth x eight blends.
- F. One coupled blend = two blends.
- G. Corner radius blend = half blend (depth assessed as $\text{RADIUS} \div 2$).

6. Assessment of Blending Equivalent of L Number of Blended Vanes per Stage

- A. Example for stage 1 vane.
- (1) L = seven vanes x 0.240 in. (6,10 mm) = 1.680 in. (42,68 mm) aggregate depth.

2. Introduction

A. General

- (1) This repair describes the procedure to restore the inner abutment faces by removing the existing flame plating, machining back the abutment faces, and applying a thicker coating.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES), in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair.
- (4) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.

REPAIR
72-33-01
Repair No.3
Page 401
Dec 1/89

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (5) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (6) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (7) Surface texture is to be 125 micro-inches (3,2 micrometres).
- (8) All tools referred to by item number in procedural steps are detailed in para.4.
- (9) Protect the component against corrosion after each operation, and place in a container for protection against damage during transit between operations.

3. Instructions

A. Remove Flame Deposition Coating

- (1) Remove the flame deposition coating from the inner abutment faces (Ref.Fig.401), following the procedure detailed in 72-09-25, Repair, using process F.
- (2) Inspect the inner abutment faces to ensure complete removal of flame deposition coating.

B. Inspect

- (1) Inspect to determine the amount of metal to be removed to produce dimension AF (Ref.Fig.403).

NOTE: Inspection fixtures Ref. tool items 1 and 2 may be used for this inspection. They were designed for use with SB.0L.593-72-8453-252, in which 0.002/0.001 in. (0,025/0,051 mm) is removed. In this repair, up to 0.009 in. (0,23 mm) is removed (measured from the original unplated abutment face), therefore allowance must be made for this when using the AFTER MACHINING gauge readings stamped on the fixture. Note that the concave side is 0.002 in. (0,051 mm) higher than the convex side.

C. Grind Inner Abutment Face (Convex Side)

- (1) Locate the vane to its relevant fixture (Ref.Table 401 and Fig.402).

- (3) Remove the vane/fixture assy. from the machine, and the vane from the fixture.
- (4) Remove all burrs produced during grinding of inner abutment face.
- (5) Inspect the vanes for the satisfactory completion of the grinding operation.

D. Grind Inner Abutment Face (Concave Side)

- (1) Locate the vane to its relevant fixture (Ref.Table 402 and Fig.402).

- (3) Remove the vane/fixture assy. from the machine, and the vane from the fixture.
- (4) Remove all burrs produced during grinding of inner abutment face.
- (5) Inspect the vanes for the satisfactory completion of the grinding operation.

E. Inspect

- (1) Check all dimensions shown on Fig.403 and 404.
- (2) Ensure that no evidence of wear remains.
- (3) Test the vane for cracks using the fluorescent dye penetrant process specified for this component in 72-33-01 Inspection/Check.

F. Detonation Flame Spray

- (1) Detonation flame spray the inner abutment faces AC and AD (Ref.Fig.403) using LWIN 40, 0.008/0.010 in. (0,20/0,25 mm) thick, following the procedure detailed in 72-09-26. No flame deposition at AM, and overspray only permissible where shown (Ref.Fig.404).

NOTE: The inner abutment faces will not be machined after spraying.

- (2) Inspect to ensure complete coverage of coating to the correct thickness, using inspection fixtures Ref. tool items 1 and 2.

G. Produce Radii

- (1) Using standard hand tools produce radii AR as shown on Fig.404.

H. Inspect and Identify

- (1) Test the vanes for cracks using the fluorescent dye penetrant process specified for this component in 72-33-01 Inspection/Check.
- (2) Using the vibro-percussion engraving technique, Ref.72-09-00 Repair, mark SAL.8.510617-8 or R4 adjacent to the existing part number.
- (3) Finally inspect the vane to ensure that the repair has been carried out satisfactorily, and that the vane is in a serviceable condition.

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

Smooth bottomed impact damage up to 0.030(0,76) deep is acceptable following blending and polishing to remove sharp edges/raised material.

Sharp bottomed indents greater than 0.010(0,25) in depth but less than 0.030(0,76) are acceptable following blending provided that the final depth of blend does not exceed 0.035(0,89).

Sharp bottomed impact damage and/or impacts in excess of 0.030(0,76) deep must be welded.

Repair of damage by blending is limited to blade rotor paths only and must not encroach within 0.100(2,50) from the vane dovetail slots.

Repair of damage by welding is limited to blade rotor paths only and must not encroach within 0.250(6,40) of the vane dovetail slots.

REPAIR

OVERHAUL

Blending is not permissible radially in line with external inserts or dowel holes, except where welding is employed to restore the profile.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimetres)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 125 (3,2) Microinches (Micrometres)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

4. REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

A. BLENDING

- 1) Blend and polish smooth bottomed impacts up to 0.030(0,76) deep to remove sharp edges/high metal. Refer fig.403 and 404
- 2) Smoothly blend out sharp bottomed impacts up to 0.030(0,76) deep. Remove the minimum amount of material necessary to facilitate the repair. Refer fig.403 and 405
- 3) Locally crack detect repaired areas. Refer TSD 594 OP 210
- 4) Mark Repair Instruction number RI B514749 or R.5A on component adjacent to normal 'assy.of' no. using the vibro-percussion engraving technique. Refer Overhaul Manual Chapter 72-09-00 Repair. Refer fig.401 for identity marking location.

B. WELDING

- 1) Remove and discard wire thread inserts. Refer Overhaul Manual Chapter 72-09-00 Repair.
- 2) Prepare impacts for welding. Refer TSD 594 OP.409
- 3) Puddle weld prepared locations. Refer TSD 594 OP.409 Use filler wire OMAT 3/54.

- 4) Locally crack detect repaired areas. Refer TSD 594 OP.210
- 5) Radiographically inspect welded areas for defects. Refer TSD 594 OP.409
- 6) Heat treat component at 650°C ± 5°C for 1 hour in vacuum. Cool in argon.
- 7) Locally dress repaired locations to restore original profile. Thinning of parent material not permissible. Refer fig.401.
- 8) Dimensionally inspect. Refer fig.401 and 402.
- 9) Crack detect. Refer Overhaul Manual Chapter 72-33-01 Inspection/Check
- 10) Vapour blast repaired areas. Ensure dovetail features are adequately masked. Refer Overhaul Manual Chapter 72-09-13 Repair Procedure B.
- 11) Assemble wire thread inserts. Insert to be installed 1 to 1.5 turns below surface. Refer Overhaul Manual Chapter 72-09-00 Repair.
- 12) Mark Repair Instruction number RI B514750 or R.5B on component adjacent to normal 'assy.of' no. using the vibro-percussion engraving technique. Refer Overhaul Manual Chapter 72-09-00 Repair. Refer fig.401 for identity marking location.

British airways

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION No. 72-526

Insert in 72-33-01 at rear of repair section in RST No. order

REASON FOR ISSUE:

To introduce a repair to cover the restoration of Rokide Z coating on the H.P. (rear) compressor casing. (MRA 92).

ACTION

BEOL REPAIR: RST 4012. Casing compressor H.P. (rear) - Restore Rokide 'Z' coating.

PROCEDURE

1. Set casing running true. Constrain, if necessary, to remove any ovality.
Check that Dia's. 32.755/32.750 and 32.690/32.685 are running true.
2. Machine to remove Rokide coating and also, the Nickel bond, by opening up the 32.205/32.200 dia. bore. Observe the min. wall (.100/.110).
3. Prepare surface for Metco coating per T.S.D. 594 Op. 704.
4. Plasma spray a bond coat using Metco 43C or Metco 43C-NS, to MS.RR 9507/109, 0.003-0.005 thick, per T.S.D. 594 Op. 704.
5. Plasma spray, using Metco 201B OK Metco 201B-NS, in accordance with T.S.D. 594 Op. 704, sufficient for final machining.
6. Machine to produce final dimensions. See Fig.1.
7. Inspect coating for cracking and adhesion per T.S.D. 594 Op. 704.
8. Final Inspect.
9. Vibro engrave RST 4012 adjacent to P/No.

N.B. The foregoing information is in accordance with OLY/SEDP/259 and D01-T7005.

1. Introduction

- A. This Repair describes the procedure for restoring defective labyrinth fins on the HP compressor rotor shaft front, in order to maintain the standard fin/housing clearances of labyrinth No.6, No.7 and No.8. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus in Tables and on illustrations: INCHES (MILLIMETRES).

2. Repair Limitations

- A. Fins which have previously been repaired by welding must not be repaired by roll forming.
- B. The first repair to each HP compressor rotor shaft front must be carried out in accordance with paragraph 3. The second repair to No.8 labyrinth is to be carried out in accordance with paragraph 3 if possible. Subsequent repairs must be carried out in accordance with paragraphs 3 and 4.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.3 and 4).

3. Summary of Operations

- A. Secure the shaft flange to the centre-lathe faceplate and set true on datum diameter B (Ref.Fig.401).
- B. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimensions (Ref.Table 401 and Fig.402). A localised "witness", not exceeding 0.003 in. (0,076 mm) in depth, is acceptable on each fin.
- C. Carefully remove any burrs.
- D. Apply the roll forming technique to increase the diameter of defective fins to the specified dimensions (Ref.Table 402 and Fig.403 and 404). Helix angle required on rolling tool is 1 deg. 30 min.
- E. Remove any folds by careful blending (Ref.Fig.405).
- F. Crack test the rotor shaft with fluorescent-penetrant.
- G. Finish machine the fins (Ref.Fig.401); a maximum of 1.000 in. (25,4 mm) of the circumference which has not cleaned up is acceptable on each fin.
- H. Polish fins to remove sharp edges.
- J. Chemically etch the rotor shaft using solution A and etching technique, (Ref.72-09-14 Repair) and repeat the test for cracks (Ref.para.F).
- K. Vapour blast the rotor shaft using grit mesh 280/500.
- L. Identify repair (Ref.Table 401). Mark the appropriate repair scheme number close to the standard part number on the rotor shaft. For the second repair, mark /2 against the existing repair scheme number.

4. Amended dimensions for repeated rolling of No.6, No.7 and No.8 Labyrinth fins

- A. Machining dimensions before roll forming (Ref.Fig.402) may be reduced by 0.008 in. (0,20 mm) maximum, if necessary.

HP COMPRESSOR ROTOR - REPAIR
LABYRINTH RING FINS REPAIRED BY ROLL FORMING

MODIFICATION NO. OL.8371C, OL.8807CEffectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-33-02	3 300c	B.929466 B.929467 B.933207 B.933206

1. Introduction

- A. This Repair describes the procedure for restoring defective fins on the HP compressor rotor labyrinth ring, in order to maintain the standard fin/housing clearances of labyrinth No.12. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus in Tables and on illustrations: INCHES (MILLIMETRES).

2. Repair Limitations

- A. Fins which have previously been repaired by welding must not be repaired by roll forming.
- B. The first repair to each HP compressor labyrinth ring must be carried out in accordance with paragraph 3. Subsequent repairs must be carried out in accordance with paragraphs 3 and 4.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.3 and 4).

3. Summary of Operations

- A. Locate the labyrinth ring in fixture (Item 6) and set true in centre-lathe on datum diameter A and face D (Ref. Fig.401).

REPAIR
72-33-02

Repair No.2

Page 401

Jun 1/82

OLYMPUS 593

MK.610-14-28

OVERHAUL

- B. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimensions (Ref. Table 402 and Fig.402). A localised "witness", not exceeding 0.003 in. (0,076 mm) depth, is acceptable on each fin.
- C. Carefully remove any burrs.
- D. Apply the roll forming technique to increase the diameter of defective fins to the specified dimensions (Ref. Table 403 and Fig.403).

NOTE: Station 1. Fins are no longer used.
Station 2 to 6 inclusive: Increase in fin diameter depends on the dimensional change between pre and post rolling dimensions from face D to the rear of the fin, Ref.Fig.403. Dimensions in column \oplus apply when pre-rolling axial dimension (face D to fin face) is at maximum (maximum axial movement obtainable). Dimensions in column \mp apply when pre-rolling axial dimension is at minimum, (minimum axial movement obtainable).
Stage 7 only: As this fin is repaired by direct rolling, and not by axial displacement, only one pre-rolling radius is required.

- E. Remove any folds by careful blending (Ref.Fig.404).
- F. Crack test the labyrinth ring with fluorescent-penetrant.
- G. Refit the labyrinth ring to fixture (Item 6), set true in lathe and finish machine the fins (Ref. Table 401 and Fig.401); a maximum of 1.000 in. (25,4 mm) of the circumference which has not cleaned up is acceptable on each fin.
- H. Polish fins to remove sharp edges.
- J. Chemically etch the ring using solution 'C' (reference 72-09-14). An immersion time of 2 minutes is required, then repeat the crack detection test reference para.F.
- K. Vapour blast the ring using grit mesh 320/400.
- L. Identify repair. Mark the repair scheme number SAL B.478094 close to the standard part number on the labyrinth ring. For the second repair, mark /2 against the existing repair scheme number.

Modification No.0L.8362C

1. Introduction

- A. This Repair describes the procedure for restoring defective labyrinth fins on the hp compressor drive shaft, in order to maintain the standard fin/housing clearances of labyrinth No.13, No.14 and No.15. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

2. Repair Limitations

- A. This Repair may be applied once only.
- B. Fins which have previously been repaired by welding must not be restored by roll forming.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.3.B).

3. Summary of Operations

- A. Secure the shaft flange to the centre-lathe faceplate; use a running centre at the small end. Set the shaft true on datum diameters A and B (Ref.Fig.401).
- B. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimensions (Ref. Fig.402). A localised "witness", not exceeding 0.003 in. (0,076 mm) is acceptable on each fin.
- C. Carefully remove any burrs.

1. Introduction

- A. This Repair describes the procedure for restoring defective interstage labyrinth fins on the HP compressor rotor shaft front, in order to maintain the standard fin/housing clearances. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

2. Repair Limitations

- A. This Repair may be applied once only.
- B. Fins which have previously been repaired by welding must not be restored by roll forming.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.3.B).

3. Summary of Operations

- A. Secure the shaft to the centre-lathe face plate on datum face A and set true on datum diameter B (Ref.Fig.401).

- B. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimensions (Ref. Fig.402). A localised "witness", not exceeding 0.003 in. (0,076 mm) is acceptable on each fin.
- C. Carefully remove any burrs.
- D. Apply the roll forming technique to increase the diameter of defective fins to the roll forming dimensions (Ref. Fig.403).
- E. Remove any folds by careful blending (Ref.Fig.403).
- F. Crack test the shaft by the process specified for this component in 72-33-02, Inspection/Check.
- G. Finish machine the fins (Ref.Fig.401); a maximum of 1.000 in. (25,4 mm) of the circumference which has not cleaned up is acceptable on each fin.
- H. Polish the fins to remove sharp edges.
- J. Chemically etch the shaft using solution A and etching technique, (Ref.72-09-14 Repair) and repeat the test for cracks (para.F).
- K. Vapour blast the rotor shaft; use alumina, garnet or quartz grit mesh 320/400.
- L. Identify repair. Mark the repair scheme number SAL B.488586 close to the standard part number on the rotor shaft.

HP COMPRESSOR ROTOR - REPAIR
STAGE 2-3 SPACER RING LABYRINTH FINS REPAIRED BY ROLL FORMING

Applicable to: Spacer Rings B.922835, B.922836

Authority: Modification No. OL.8399C

1. Introduction

- A. This Repair describes the procedure for restoring defective labyrinth fins on the hp compressor rotor stage 2-3 spacer ring in order to maintain the standard fin/housing clearances. The diameter of each fin is first increased by roll forming then machined to standard dimensions.
- B. Refer to Chapter 72-09-00, Repair for all standard practices, tolerancing and the roll forming technique applicable to this repair procedure.
- C. Dimensions are shown thus: INCHES (MILLIMETRES).

2. Repair Limitations

- A. This Repair may be applied once only.
- B. Fins which have previously been repaired by welding must not be restored by roll forming.
- C. Verify that there is adequate material at each defective location to permit machining to the dimensions before roll forming (Ref.para.3.C).

3. Summary of Operations

- A. Strip the aluminium enamel from the component.
- B. Locate the spacer ring in fixture (Item 5) and set true on datum face A and datum diameter B (Ref.Fig.401).

- C. Clean up defective fins; remove only the minimum amount of material to achieve the specified dimensions (Ref. Fig.402). A localised "witness", not exceeding 0.003 in. (0,076 mm) is acceptable on each fin.
- D. Carefully remove any burrs.
- E. Apply the roll forming technique to increase the diameter of defective fins to the roll forming dimensions (Ref.Fig.403).
- F. Remove any folds by careful blending (Ref.Fig.403).
- G. Crack test the spacer by the process specified for this component in 72-33-02, Inspection/Check.
- H. Finish machine the fins (Ref.Fig.401); a maximum of 1.000 in. (25,4 mm) of the circumference which has not cleaned up is acceptable on each fin.
- J. Polish the fins.to remove sharp edges.
- K. Repeat the test for cracks (Ref. para.G).
- L. Apply high-heat resisting aluminium enamel all over the spacer ring except spigot diameters AB and AC, faces AD and areas 0.650 in. (16,510 mm) in diameter around holes on faces AE.
- M. Identify repair. Mark the repair scheme number SAL B.488595 close to the standard part number on the spacer ring.

4. Instructions

A. General.

- (1) Test blades for cracks, before and after blending, by the fluorescent dye process specified for the blades in 72-33-02 Inspection/Check; reject cracked blades.
- (2) Blades with dents which deform the opposite surface of the blade are not acceptable for blending; reject blades with this form of damage.
- (3) A blend in zone Z must not run out into zone X.

B. Procedure.

- (1) Crack test blades to determine full extent of damage. Refer to the fluorescent dye process specified for the blades in 72-33-02 Inspection/Check.
- (2) Dress to remove damage.

CAUTION: IF MECHANICAL BLENDING METHODS ARE USED, ENSURE THAT BLADES ARE NOT OVERHEATED.

- (a) Polish acceptable surface dents (Ref. para.4.(2)) to remove burrs.
- (b) Blend torn, rough or scored edges to a depth 20 per cent greater than the depth of damage, provided that specified limits are not exceeded.
- (c) If adjacent blends interfere, remove material from between them to produce a coupled blend.
- (d) Profile edge blends smoothly into the aerofoil shape (Ref.Fig.401).
- (e) Polish blends and defective areas.
- (f) Remove only the minimum amount of material consistent with the specified requirements and dimensions.

OVERHAUL

- (g) In zone X, blending is permitted only as defined in (i) and (ii).
 - (i) Blend light nicking of the edges.
 - (ii) Polish out light surface scratches; 0.002 in. (0,050 mm) maximum permissible depth.
- (h) For opposing blends the chordal width must not be reduced by more than dimension A.
- (j) When blending within dimension D of blade tip, blend out towards the tip.
- (k) Blending and polishing marks must be only in a radial direction, from root to tip.
- (l) Blend and polish to a surface finish of 32 MICROINCHES (0,8 MICROMETRES).
- (3) Clean blades by the process specified for the blades in 72-33-02 Cleaning.
- (4) Vapour degrease the vanes.

CAUTION: OBSERVE THE RESTRICTION ON THE PERIOD OF IMMERSION FOR TITANIUM COMPONENTS (REF.72-09-00 CLEANING) FOR STAGE 1, 2 AND 3 BLADES.
- (5) Etch the blades (Ref.72-09-14 Repair).
 - (a) Use Solution A for Stages 1, 2 & 3 blades, either by Immersion or by Swab etch.
 - (b) For Immersion etching proceed as follows:
 - (i) Mask the blade roots and other areas not to be etched, with approved Acid Resistant Lacquer (I.C.I.F230-2006).
 - (ii) Etch the blades for the minimum time to achieve the desired surface for inspection, up to a maximum time of 20 seconds after the onset of gassing.
 - (iii) Remove the Lacquer by vapour degreasing (Ref.72-09-00 Cleaning).

SNECMA

OVERHAUL

- (c) For Swab etching, apply the etch to the repaired area only. Do not allow the etch solution to come into contact with blade roots. Swab etch for a minimum time of 30 seconds.
- (d) Use Solution B for Stages 4, 5, 6 & 7 blades, either by Immersion or by Swab etch.
- (e) For Immersion etching proceed as follows:
 - (i) Mask the blade roots and other areas not to be etched, with approved Acid Resistant Lacquer (I.C.I.F230-2006).
 - (ii) Etch the blades for the minimum time to achieve the desired surface for inspection, up to a maximum time of 60 seconds.
 - (iii) Remove the Lacquer by vapour degreasing (Ref.72-09-00 Cleaning).
- (f) For Swab etching, apply the etch to the repaired area only. Do not allow the etch solution to come into contact with blade roots. Swab etch for a minimum time of 30 seconds.
- (g) Remove the masking lacquer from blades by vapour degreasing to the approved specification (Ref.72-09-00 Cleaning).
- (6) Repeat the test for cracks.
- (7) Glass bead peen stage 1, 2 and 3 blades (Ref. 72-09-15 Repair).
 - (a) Apply masking tape to the blade roots and other areas which are not to be peened.
 - (b) Peen to the Parameters for Procedure A specified in the glass bead peening procedure, for a period of three to five seconds per sq. in. (645 sq. mm) of blade surface.
 - (c) Remove the masking tape from the blades.

sneema

(8) Vapour blast and passivate stage 4, 5, 6 and 7 blades (Ref.72-09-13 Repair).

- (a) Apply masking tape to the blade roots and other areas which are not to be blasted.
- (b) Vapour blast to the Parameters for Procedure A and Special Details for Blades and Vanes specified in the vapour blasting procedure.
- (c) Remove masking tape from the blades.
- (d) Passivate stage 4, 5, 6 and 7 blades for a minimum period of two hours.

5. Assessment of Amount of Blending per Blade (All Stages)

- A. Blades may be blended in several positions provided that the total extent of blending is not more than the equivalent of two blends to the maximum in zone Z.
- B. Depth of blending is controlled by zones.
- C. The maximum permissible number of blended blades per stage, when blended to maximum limits, is identified as L on the illustrations.

MK.610-14-28
OVERHAUL

- D. Where blades are not blended to the permissible maximum, this number (Ref. para.C.) may be increased, provided that the aggregate of the blending does not exceed L.
- E. Permissible blending is controlled by depths e.g. stage 1 blade.
- (1) 0.150 in. (3,81 mm) depth x two blends = 0.300 in. (7,62 mm) total = maximum blended blade.
 - (2) This maximum may be obtained as defined in (a) and (b), or by any combination of depths the total of which does not exceed 0.300 in. (7,62 mm).
 - (a) 0.100 in. (2,54 mm) depth x three blends.
 - (b) 0.075 in. (1,90 mm) depth x four blends.
- F. One coupled blend = two blends.
- G. Dimension D blend = one blend.
- H. Dimension E blend = half blend depth assessed as
RADIUS \div 2.

6. Assessment of Blending Equivalent to L Number of Blended Blades per Stage

A. Example for stage 1 blade.

- (1) L = three blades x 0.300 in. (7,62 mm) depth = 0.900 in. (22,86 mm) aggregate depth.
- (2) This aggregate may be obtained as defined in (a) and (b), or by any aggregate of blended blades which does not exceed 0.900 in. (22,86 mm).
 - (a) 0.180 in. (4,57 mm) depth x five blades.
 - (b) 0.150 in. (3,81 mm) depth x six blades.

7. HP Compressor Blades Stage 2 Only

NOTE: This para. only applies to the HP compressor rotor stage 2 blades that have been blended.

A. Frequency Check Blended Blades.

- (1) Check the frequency number marked on the base of each blade.
- (2) If the frequency number is above 2060 Hz, proceed to para.8.
- (3) If the frequency number is between 2040 and 2060 Hz then the blade must be re-frequency checked as detailed in SB.72-8777-302 para.2.C. If the frequency is above 2040 Hz, line through the old number and re-number with the new frequency. If the frequency is below 2040 Hz, reject the blade.

8. Identify Repair (Ref. Table 401)

- A. Mark the repair scheme number, appropriate to the stage of blades, close to the standard part number on the blades (Ref.72-09-00 Repair).

NOTE: Do not mark the number of this scheme SAL B.930281 on blades.

HP ROTOR STAGE	REPAIR SCHEME NUMBER
1	SAL B.930282
2	SAL B.930283

HP COMPRESSOR ROTOR SHAFT FRONT - REPAIR NO.6 LABYRINTH
FINS RESTORED BY PLASMA WELDING
MODIFICATION NO.OL.8427(C)

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-33-02	1 260	B.927125, B.927126, B.927129, B.927130, B.927131, B.927132.

CAUTION: THIS PROCEDURE CONTAINS OPERATIONS WHICH ARE SUBJECT TO COMPONENT MANUFACTURING TECHNIQUE (CMT) CONTROL. THESE OPERATIONS SHALL NOT BE VARIED WITHOUT REFERENCE TO THE MANUFACTURER.

2. Introduction

A. General.

- (1) This repair describes the procedure for restoring the worn No.6 labyrinth fins on the HP compressor rotor shaft front, to maintain the labyrinth fin/housing clearance. The rotor shaft front finned area is reduced in diameter by machining, the diameter restored using the plasma welding technique, then the welded area machined to produce new fins.
- (2) Refer to Chapter 72-09-00 Repair, for all standard practices applicable to this repair procedure.
- (3) Dimensions in Tables and on illustrations are shown thus: INCHES (MILLIMETRES).
- (4) The operations that are subjected to Component Manufacturing Technique Control are indicated CMT.
- (5) A test piece shall be produced and subjected to metallurgical examination; test pieces are required initially, and upon any change of airline operator, sub-contractor, machine or welding equipment. CMT

3. Test Piece

A. Produce Test Piece.

- (1) Produce a suitable test piece (Ref.Fig.401), using conventional machining methods, in material specification MSRR 8634 (in the fully heat treated condition). The geometry of the test piece must conform to the standard part, with the addition of the weld build diameter to provide a datum for the heat affected zone. CMT
- (2) It is permissible to use an unserviceable standard part as the test piece. In this case no heat treatment is required. CMT

B. Plasma Weld Test Piece (Ref.Fig.401).

- (1) Build up the representative No.6 labyrinth diameter in layers to a minimum depth of 0.090 in. (2,286 mm) using the plasma welding technique. Refer to Table 401 and Chapter 72-09-12, Repair, for Plasma weld procedure. Three layers of weld deposit should be sufficient to produce the No.6 labyrinth. During this operation, carry out the following: CMT
 - (a) Fifteen minutes must elapse between the deposit of each weld layer. CMT
 - (b) Clean each weld deposit using a rotary stainless steel brush. CMT
 - (c) Remove weld bead irregularities, cavities, etc. at the completion of each weld deposit using a non-abrasive cutter. CMT

C. Metallurgical Examination of the Test Piece.

NOTE: The following examination must be carried out by the controlling laboratory.

- (1) Produce four suitable micro-sections at 90° from the test piece weld surface. CMT

- (2) Subject the micro-sections to a VPN hardness check using a 5 kg load and a 2/3rds objective at 0.020 in. (0,508 mm) increments, traversed across the micro-sections. Check that the heat affected zone is limited to the area shown; (Ref.Fig.401). CMT

4. Instructions

A. Machine No.6 Labyrinth Fins.

NOTE: During the initial (pre-welding) turning operations of the rotor shaft front, conventional machining methods apply; (Ref.Fig.403) for machining dimensions.

- (1) Locate the component in the fixture; ref. tool item 1 (Fig.402). CMT
- (2) Locate and secure the component/fixture assembly to centre lathe and set true to datum B. CMT
- (3) Turn to remove defective No.6 labyrinth fin to produce the dimensions shown in Fig.403, using the form tool; ref. tool item 2. CMT
- (4) Remove all burrs from the machined area using conventional hand tools, then remove the component/fixture assembly from the lathe and the component from the fixture. CMT

B. Build up the Labyrinth Fin Area.

- (1) Build up the No.6 labyrinth fin location to a minimum depth of 0.090 in. (2,2860 mm) using the plasma welding technique, sufficient to produce the labyrinth fins, to the dimension shown at Fig.403. Refer to Table 401 and Chapter 72-09-12, Repair, for the Plasma welding procedure. Three layers of weld deposit should be sufficient to produce the No.6 labyrinth. During this operation, carry out the following: CMT
- (a) Fifteen minutes must elapse between the deposit of each weld layer. CMT

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
72-33-02	1 260	B.927125, B.927126, B.927129, B.927130, B.927131, B.927132

CAUTION: THIS PROCEDURE CONTAINS OPERATIONS WHICH ARE SUBJECT TO COMPONENT MANUFACTURING TECHNIQUE (CMT) CONTROL. THESE OPERATIONS SHALL NOT BE VARIED WITHOUT REFERENCE TO THE MANUFACTURER.

2. Introduction

A. General.

- (1) This repair describes the procedure for restoring the worn No.7 labyrinth fins on the HP compressor rotor shaft front, to maintain the labyrinth fin/housing clearance. The rotor shaft front finned area is reduced in diameter by machining, the diameter restored using the plasma welding technique, then the welded area machined to produce new fins.
- (2) Refer to Chapter 72-09-00 Repair, for all standard practices applicable to this repair procedure.
- (3) Dimensions in Tables and on illustrations are shown thus: INCHES (MILLIMETRES).
- (4) The operations that are subjected to Component Manufacturing Technique Control are indicated CMT.
- (5) A test piece shall be produced and subjected to metallurgical examination; test pieces are required initially, and upon any change of airline operator, sub-contractor, machine or welding equipment.

3. Test Piece

A. Produce Test Piece.

- (1) Produce a suitable test piece (Ref.Fig.401), using conventional machining methods, in material specification MSRR 8634 (in the fully heat treated condition). The geometry of the test piece must conform to the standard part, with the addition of the weld build diameter to provide a datum for the heat affected zone. CMT
- (2) It is permissible to use an unserviceable standard part as the test piece. In this case no heat treatment is required. CMT

B. Plasma Weld Test Piece (Ref.Fig.401).

- (1) Build up the representative No.7 labyrinth diameter to a minimum depth of 0.120 in. (3,048 mm), using the plasma weld technique. Refer to Table 401, Fig.402 and Chapter 72-09-12, Repair, for the Plasma welding procedure. Three layers of weld deposit should be sufficient to produce the No.7 labyrinth. During this operation, carry out the following: CMT
 - (a) The turntable is to be tilted upwards at an angle of 20° to 25° to provide access for the torch and filler wire attachment. CMT
 - (b) Fifteen minutes must elapse between the deposit of each weld layer. CMT
 - (c) Clean each weld deposit using a rotary stainless steel brush. CMT
 - (d) Remove weld bead irregularities, cavities, etc., at the completion of each weld deposit using a non-abrasive cutter. CMT

C. Metallurgical Examination of the Test Piece.

NOTE: The following examination must be carried out by the controlling laboratory.

- (1) Produce four suitable micro-sections at 90° from the test piece weld surface. CMT

- (2) Subject the micro-sections to a VPN hardness check using a 5 kg load and a 2/3rds objective at 0.020 in. (0,508 mm) increments, traversed across the micro-section. Check that the heat affected zone is limited to the area shown, (Ref.Fig.401).

CMT

4. Instructions

A. Machine No.7 Labyrinth Fins.

NOTE: During the initial (pre-welding) turning operations of the rotor shaft front, conventional machining methods apply; ref.Fig.404 for machining dimensions.

- (1) Locate the component in the fixture; ref. tool item 1 (Fig.403). CMT
- (2) Locate and secure the component/fixture assembly to a centre lathe and set true to datum B. CMT
- (3) Turn to remove the tip of the first fin to produce 7.400/7.390 in. (187,96/187,71 mm) diameter. Turn to remove the rear fins to produce 7.302/7.300 in. (185,47/185,42 mm) diameter and blend with the base radius of the first fin as shown in Fig.404. CMT
- (4) Remove all burrs from the machined area using conventional hand tools, then remove the component/fixture assembly from the lathe and the component from the fixture. CMT

B. Build-up the Labyrinth Fin Area.

- (1) Build-up the No.7 labyrinth fin location to a minimum depth of 0.120 in. (3,05 mm), using the plasma weld technique, sufficient to produce the labyrinth fins to the dimensions shown at Fig.404. Refer to Table 401, Fig.402 and Chapter 72-09-12, Repair, for the Plasma welding procedure. Three layers of weld deposit should be sufficient to produce the No.7 labyrinth. During this operation, carry out the following: CMT
- (a) The turntable is to be tilted upwards at an angle of 20° to 25° to enable access for the torch and filler wire attachment. CMT

3. Test Piece

A. Produce Test Piece.

- (1) Produce a suitable test piece, (Ref.Fig.401), using conventional machining methods in material specification MSRR 8634 (in the fully heat treated condition). The geometry of the test piece must conform to the standard part, with the addition of the weld build diameter to provide a datum for the heat affected zone. CMT
- (2) It is permissible to use an unserviceable standard part as the test piece. In this case, no heat treatment is required. CMT

B. Plasma Weld Test Piece (Ref.Fig.401).

- (1) Build up the representative No.8 labyrinth diameter to a minimum depth of 0.080 in. (2,032 mm) using the plasma welding technique. Refer to Table 401 and Chapter 72-09-12, Repair, for Plasma Weld procedure. Four weld deposits should be sufficient to produce No.8 labyrinth. During this operation carry out the following: CMT
 - (a) When an unserviceable standard part is used as a test piece, the turntable is to be positioned at 35° to the vertical torch to allow for maximum access to the rear fin; (Ref.Fig.404). CMT
 - (b) Fifteen minutes must elapse between each weld deposit. CMT
 - (c) Clean each weld deposit using a rotary stainless steel brush. CMT
 - (d) Remove weld bead irregularities, surface cavities, etc., at the completion of each deposit, using a non-abrasive cutter. CMT

CMT

- (5) Remove all burrs and any surplus weld, using conventional hand tools. Remove the fixture from the lathe and the rotor shaft front from the fixture.
- (6) Inspect the machined area to ensure that the labyrinth fin dimensions have been achieved; (Ref. Fig.403).

5. Chemically Etch the No.8 Labyrinth Fin Area

WARNING: OBSERVE THE WARNINGS GIVEN IN CHAPTER 72-09-14, REPAIR.

- A. Mask off the rotor shaft front using "I.C.I. Stopping Off Red Lacquer" to specification F.230/2006. Ensure that only the No.8 labyrinth fin area is exposed to the etching solution.

CMT

- B. Using the etching technique specified in Chapter 72-09-14, Repair, solution A, immerse the shaft in the etching solution for sufficient time to achieve the desired surface up to a maximum period of 20 seconds after the onset of gassing.

CMT

- C. Wash and remove the protective lacquer by swabbing with trichloroethane.

CMT

OVERHAUL

6. Crack Detect the Labyrinth Area

- A. Crack detect the labyrinth area using the fluorescent dye penetrant technique F2A as specified in Chapter 72-33-02, Inspection/Check. CMT

7. Vapour Blast the Labyrinth Area

- A. Mask off the rotor shaft front with a suitable waterproof masking tape; ensure that only the repair area of the labyrinth is exposed. CMT
- B. Vapour blast the labyrinth finned area using the technique specified in Chapter 72-09-13, Repair, procedure B. Remove masking tape at the completion of vapour blasting. CMT

8. Identify Repair

- A. Using the electro-chemical marking technique, ref. Chapter 72-09-00, Repair, mark on SAL B.488618 or R9 close to the existing part number.

9. Special Tools, Fixtures and Equipment

- A. The following tools, fixtures and equipment are required to complete this repair:

<u>Description</u>	<u>Quantity</u>	<u>Tool No.</u>	<u>Item No.</u>
Fixture	1	S3S.15507000	1
Form tool	1	S3S.15547000	2

10. Finally Inspect

- A. Finally inspect the rotor shaft front to ensure the repair has been carried out satisfactorily and that the rotor shaft front is in a serviceable condition.
- B. Place the rotor shaft front in a suitable container and store as required.

3. Instructions

A. Machine Holes to Remove Damage.

- (1) Visually inspect the disk and identify the holes that require repair.
- (2) Locate the disk onto a suitable jig boring machine and true up to datum B (Ref.Fig.401).
- (3) Ream the damaged holes (identified at A.(1)) 0.3998/0.4008 in. (10,155/10,18 mm) diameter using reamer, Ref. Tool Item 1, (Ref.Fig.401), at a Speed of 370 rpm (11m/min) and a feed rate of 0.028in/per (0,07mm/per). Use GP Soluble Oil 30:1 diluted coolant. CMT
- (4) Chamfer the reamed holes 0.020/0.030 in. (0,51/0,76 mm) at an angle of 45 degrees, (Ref.Fig.401).
- (5) Remove the disk from the jig borer and remove sharp corners 0.010/0.020 in. (0,25/0,51 mm) (Ref.Fig.401).
- (6) Visually inspect for removal of damage and ensure that all machining parameters have been achieved.

B. Crack Detect.

- (1) Crack test the disk using the magnetic particle crack detection technique specified for this component in Chapter 72-33-02 Inspection/Check. CMT

C. Identify.

Mark salvage B.495681 or R10 close to the existing part number, using the vibro-percussion engraving technique as specified in Chapter 72-09-00 Repair.

2. Introduction

A. General.

- (1) This repair describes the procedure to be followed in order to restore to a serviceable condition HP compressor rotor blades (stages 4 to 7) that have been rendered unserviceable through wear occasioned by excessive tip-rub in service.
- (2) The defective blade is restored to an acceptable condition by cold coining the blade tip to produce an extension that is then machined to the required overall dimension.

PRINTED IN ENGLAND

TN40255

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (3) Refer to Chapter 72-09-00 Repair, for all Standard Practices applicable to this repair procedure.
- (4) Dimensions in tables and on illustrations are shown thus: INCHES (MILLIMETRES).
- (5) Remove all sharp edges 0.004 to 0.020 in. (0,102 to 0,508 mm), unless otherwise stated.
- (6) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm), unless otherwise stated.
- (7) This repair covers stages 4 to 7 rotor blades in the HP compressor; each stage has its own salvage number and repair scheme number suffix as follows:

<u>Stage</u>	<u>Salvage No.</u>	<u>Repair Scheme No.</u>
4	B.495644	R.13A
5	B.495645	R.13B
6	B.495646	R.13C
7	B.495647	R.13D

- (8) Unless a statement is made to the contrary, the steps of procedure detailed in paragraph 3 are applicable to all stages of blades covered by this repair.
- (9) All tools referred to by item number in procedural steps are detailed in paragraph 4.
- (10) Ensure that the blades are suitably protected, to avoid corrosion and damage, upon completion of this repair.

B. Repair Limitations.

- (1) Each blade may be restored to a serviceable condition once only by the method detailed in this repair.

Salvage Number, Stage and Part Number Identification
Table 401

3. Instructions

A. Check the HP Compressor Rotor Blade.

- (1) Check the blade part number to ascertain which salvage is applicable (Ref. Table 401).
- (2) Check the overall length of blade, from blade datum to tip, to determine blade acceptability for repair.
 - (a) Install blade in fixture (Ref.Fig.401 and para.4. Item 9) and clamp in position in the lowest fir-tree serration.
 - (b) Place fixture/blade and a dial indicator gauge on surface table.
 - (c) Set fixture gauge pin to abut blade tip.

REPAIR

MK.610-14-28

OVERHAUL

- (d) Zero the dial indicator gauge on head of appropriate height pin.

NOTE: This zero reading equates to the minimum height of a serviceable blade.

- (e) Take comparative reading on head of gauge pin.
- (f) Remove blade from fixture, and reject any blade that does not conform to the minimum height requirements.

B. Cold-coin the HP Compressor Rotor Blade.

- (1) Select coining dies for the stage of blade being repaired (Ref. para. 4. Item 1, 3, 5 or 7).
- (2) Assemble the top (convex) and bottom (concave) dies in a suitable stamping fixture; secure dies in position (Ref. Fig. 402, 403, 404 and 405).
- (3) Assemble stamping fixture/coining dies in a hydraulic press; secure fixture to press.
- (4) Secure root location block in position on stamping fixture (Ref. Fig. 402, 403, 404 and 405).
- (5) Set blade tip on bottom die, convex face down, and support blade root in location block; ensure bottom of root abuts location block (Ref. Fig. 402, 403, 404 and 405).

NOTE: The root location block supports the blade in the correct position relative to the die.

- (6) Cold-coin the blade tip to produce the required extension (Ref. Fig. 407); apply 40 tons force (approx.) for 10 seconds (max.).
- (7) Remove blade from die and check that sufficient elongation, within the quoted limits (Ref. Fig. 407), has been achieved to permit machining to final dimensions (Ref. Fig. 408); use inspection fixture and dial indicator gauge (Ref. para. 3.A.(2)). Re-coin blade tip if required.
- (8) Remove coining dies and stamping fixture from hydraulic press.

C. Inspect the HP Compressor Rotor Blade.

- (1) Visually inspect the blade for excessive 'stepping' or indentations resulting from the coining operation; lightly polish the blade, at leading edge and on convex side only, to blend out coining marks.

NOTE: Refer to the controlling laboratory for details of blade untwisting checks if required.

- (2) Test the blade for cracks; use the fluorescent dye penetrant process F2A (Ref.72-09-00 Inspection/Check).

D. Machine the HP Compressor Rotor Blade.

- (1) Install two previously coined blades from the same stage in appropriate milling fixture (Ref.para.4, Item 2, 4, 6, or 8 and Fig.406).
- (2) Install the milling fixture/blades on suitable milling machine.
- (3) Machine the blade tips to produce the required dimensions and surface finish (Ref.Fig.408).
- (4) Remove milling fixture/blades from milling machine and remove blades from fixture.
- (5) Remove burrs from blade tip and blend leading and trailing edges at blade tip to remove any excess material; use conventional hand tools.

E. Etch the HP Compressor Rotor Blade Tip.

WARNING: ETCHING SOLUTIONS ARE CORROSIVE. OPERATORS MUST WEAR COMPLETE BODY PROTECTIVE CLOTHING AND FACE MASKS AND MUST COMPLY WITH THE SAFETY PRECAUTIONS DETAILED IN CHAPTER 72-09-14 REPAIR.

- (1) Mask the blade root and that part of the blade aerofoil not being etched; use I.C.I. Stopping-off Red Lacquer F230-2006.

OVERHAUL

sneema

- (2) Etch the previously coined and machined area of the blade tip (Ref.72-09-14 Repair) for a period of 30 seconds from onset of gassing; use solution 'D' detailed in referenced procedure.
- (3) Remove masking lacquer from blade by vapour degreasing to the approved specification (Ref.72-09-00 Cleaning).

F. Inspect the HP Compressor Rotor Blade.

- (1) Test the blade for cracks; use the fluorescent dye penetrant process F2A (Ref.72-09-00 Inspection/Check).

G. Vapour Blast the Aerofoil Section of the HP Compressor Rotor Blade.

- (1) Apply approved masking tape to the blade root and other areas of the blade aerofoil which are not to be vapour blasted.
- (2) Vapour blast the blade (Ref.72-09-13 Repair); use procedure 'A' detailed in referenced procedure.
- (3) Remove masking tape from the blade.
- (4) Passivate the blade for a minimum period of two hours (Ref.72-09-13 Repair).

H. Identify Repair.

- (1) Mark the repair scheme number (Ref. para.2.A.(7) close to the standard part number on the repaired blade; use the vibro-percussion engraving method (Ref. 72-09-00 Repair).
- (2) Re-part number (Ref.72-09-00 Repair) repaired pre-modification OL.8576 standard blades (Ref. Table 402). Use the vibro-percussion engraving method.

New Part Numbers for Repaired Pre modification OL.8576 Blades
Table 402

J. Inspect the HP Compressor Rotor Blade.

- (1) Carry out a final visual inspection and dimensional check of the blade to ensure satisfactory completion of repair and suitability for service; use the inspection fixture (Ref.para.4 Item 9 and Fig.401).
- (2) Endorse inspection records to ensure that blades to the standard of this repair scheme are not assembled in sets with standard blades to pre-modification OL.8576.
